AIRBUS TRAINING

 **AIRBUS®**

SUBJECT : CDSS SMOKE FROM LCD MONITOR.

REASON FOR ISSUE :

A case of burning smell/smoke emanations, caused by a failure of the Cockpit Door Surveillance System (CDSS) LCD monitor (short-circuit) was reported to Airbus. In such a case, smoke emanating from the LCD can be stopped by de-activating the CDSS.

This Temporary Revision is issued to inform operators that, if smoke and/or burning smell is detected, it may come from the LCD monitor. If such is the case, and as specified in the SMOKE procedure, the faulty equipment must be isolated (by switching OFF the CKPIT DOOR VIDEO pushbutton).

VALIDITY : All A320 aircraft equipped with the Video Surveillance System, associated with the reinforced cockpit door (CDSS).

FILING INSTRUCTIONS :

Insert the following pages :

TR N° 398-1 page 1 of 2, in front of the first divider of the QRH.
TR N° 398-1 page 2 of 2, facing QRH 1.08.

This Temporary Revision has been issued after normal revision N° 37.
Do not remove it until instructed to do so.

SUBJECT : C/B RESET PROC FOR ACSC

REASON FOR ISSUE :

This Temporary Revision is issued for aircraft with the Air Conditioning System Controller 1803B0000-02, in order to provide Operators with the ACSC C/B reset procedure to apply in the case of a "PACK REGUL FAULT" triggered on ground.

VALIDITY :

Aircraft with the Air Conditioning System Controller 1803B0000-02 (Mod 35863).

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions, and insert the following pages :

TR N° 521-1, page 1 of 2, in front of the first divider of the QRH.

TR N° 521-1, page 2 of 2, facing QRH 2.36.

This Temporary Revision has been issued after normal revision N° 39.
Do not remove it until instructed to do so.

AIRBUS TRAINING  A320 SIMULATOR	TEMPORARY REVISION N° 604-1	APR 08 ISS.A	0.0
-----------------------------------------------------------------------------------------------------------------------	------------------------------------	-----------------	------------

TR N° 604-1 PAGE 1 OF 2

SUBJECT : Improvement of the CIDS reset procedure following an uncommanded EVAC horn activation.

REASON FOR ISSUE :

This Temporary Revision is issued in order to provide Operators with an enhanced CIDS reset procedure in the case of an uncommanded EVAC horn activation.

VALIDITY :

A319/A320 aircraft that have a modified CIDS power supply (mod 24771) or, A318/A319/A320 aircraft that have an enhanced CIDS (mod 33100 and 33300).

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions, and insert the following pages :

TR N° 604-1 Page 1 of 2, in front of the first divider of the QRH.
TR N° 604-1 Page 2 of 2, facing 2.37.

This Temporary Revision has been issued after normal revision N° 41.
Do not remove it until instructed to do so.

SUBJECT : AUTOPILOT (AP) – MINIMUM EQUIPMENT IN CAT II/CAT III

REASON FOR ISSUE :

This Temporary Revision is issued to provide Operators with the updated required equipment list for CAT II and CAT III landing operations.

The Flight Director (FD) is not required for CAT II and CAT III landing operations.

The loss of landing capabilities is related to the loss of the AP, and not to the loss of the FD.

As a result, the FD information was removed from the first line of the required equipment list that takes into account the AP.

VALIDITY :

All A320 family aircraft.

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions, and insert the following pages :

TR N° 608-1 page 1 of 2, in front of the first divider of the QRH.

TR N° 608-1 page 2 of 2, facing 5.04.

This Temporary Revision has been issued after normal revision N° 42.
Do not remove it until instructed to do so.

AIRBUS TRAINING  A320 SIMULATOR	TEMPORARY REVISION N° 609-1	JUL 08 ISS.A	0.0
-----------------------------------------------------------------------------------------------------------------------	------------------------------------	-----------------	------------

TR N° 609-1 PAGE 1 OF 2

SUBJECT :

LGCIU reset procedure.

REASON FOR ISSUE :

This Temporary Revision (TR) is issued to update the LGCIU reset procedure on ground. The new procedure aims to prevent any retraction of the landing gear, when the aircraft is on ground during the LGCIU reset. Therefore, in accordance with the procedure, there should be no more pressure in the green hydraulic system before any LGCIU reset.

VALIDITY : All A318/A319/A320/A321 aircraft

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions, and insert the following pages :

TR N° 609-1, Page 1 of 2, in front of the first divider of the QRH.
TR N° 609-1, Page 2 of 2, facing 2.39.

This Temporary Revision has been issued after normal revision N° 42.
Do not remove it until instructed to do so.

TEMPORARY REVISION N° 614-1

AUG 08

ISS.A

0.0

TR N° 614-1 PAGE 1 OF 2

SUBJECT :

WINDSHEAR AHEAD

REASON FOR ISSUE :

This Temporary Revision is issued to avoid duplication of the go-around procedure in the WINDSHEAR AHEAD procedure : The action lines related to the go-around are removed, and a reference to the GO-AROUND procedure is added.

VALIDITY :

Aircraft that have the Predictive Windshear function.

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions, and insert the following pages :

TR N° 614-1 page 1 of 2, in front of the first divider of the QRH.
TR N° 614-1 page 2 of 2, facing 1.27

This Temporary Revision has been issued after normal revision N° 42.
Do not remove it until instructed to do so.

SUBJECT : QRH Normal Procedures – Part 1

REASON FOR ISSUE

In the last revision of the FCOM VOL3 / QRH (REV 42), it was decided to remove all callouts from the different sections of the SOP, and to replace them by action lines.

Example :

is now replaced by :

- FLAPS 1 SELECT

However, this change does not reflect anymore the fact that the PF requests the selection of the flaps/slats and the landing gear before the PNF performs the action.

This Temporary Revision is issued in order to clarify that the Standard Operating Procedures and the task sharing remain unchanged : The PF orders a slats/flaps configuration change (or the landing gear retraction/extension), and then, the PNF performs the corresponding action.

Therefore for the same example the QRH is revised as follows :

- FLAPS 1 ORDER | - FLAPS 1 SELECT

VALIDITY : A318/A319/A320/A321 aircraft with :

- The fully electrical braking system (Mod 26925), and
 - The modification(s) that prevent(s) Nose-Wheel Steering reconnection during pushback (Mod 35216 or 35249 or 36368 or 36853 or 36994)

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions and insert the following pages :

TR N° 630-1 page 1 of 4, in front of the first divider of the QRH.

TR N° 630-1 page 2 of 4, facing 3.04.

TR N° 630-1 page 3 of 4, facing 3.05.

TR N° 630-1 page 4 of 4, facing 3.10.

This Temporary Revision has been issued after normal revision N° 42.
Do not remove it until instructed to do so.

TR N° 631-1 PAGE 1 OF 4

SUBJECT : QRH Normal Procedures – Part 2

REASON FOR ISSUE :

In the last revision of the FCOM VOL3 / QRH (REV 42), it was decided to remove all callouts from the different sections of the SOP, and to replace them by action lines.

Example :

is now replaced by :

- FLAPS 1 SELECT

However, this change does not reflect anymore the fact that the PF requests the selection of the flaps/slats and the landing gear before the PNF performs the action.

This Temporary Revision is issued in order to clarify that the Standard Operating Procedures and the task sharing remain unchanged : The PF orders a slats/flaps configuration change (or the landing gear retraction/extension), and then, the PNF performs the corresponding action.

Therefore for the same example the QRH is revised as follows :

- FLAPS 1 ORDER | - FLAPS 1 SELECT

VALIDITY : A318/A319/A320 aircraft

FILING INSTRUCTIONS :

Update the Record of Temporary Revisions and insert the following pages :

TR N° 631-1 page 1 of 4, in front of the first divider of the QRH.

TR N° 631-1 page 2 of 4, facing 3.07.

TR N° 631-1 page 3 of 4, facing 3.08.

TR N° 631-1 page 4 of 4, facing 3.09.

This Temporary Revision has been issued after normal revision N° 42.
Do not remove it until instructed to do so.

IMPORTANT**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.

As a general rule, the procedures displayed on the ECAM are not provided in the QRH (refer to FCOM 3.02).

TASKSHARING FOR ABN/EMER PROC

For all abnormal/emergency procedures, the tasksharing is as follows :

R PF – Pilot flying – Responsible for the :

- Thrust levers
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications

R PNF – Pilot non flying – Responsible for the :

- Monitoring and reading aloud the ECAM and checklists
- Performing required actions or actions requested by the PF, if applicable
- Using engine master switches, IR and guarded switches with PF's confirmation.

ECAM CLEAR

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

ABN/EMER PROC INITIATION

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until :

- The appropriate flight path is established, and
- The aircraft is at least 400 feet above the runway, if a failure occurs during takeoff, approach, or go-around. (In some emergency cases, provided the appropriate flight path is established, the pilot flying may initiate actions before this height).

NORMAL CHECKLIST

Normal C/L are initiated by the PF and read by the PNF.

The PF shall respond after having checked the existing configuration. When both pilots have to respond, "BOTH" is indicated.

USE OF SUMMARIES

GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure :

The ECAM should be applied first.

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Not Flying (PNF) refer to the corresponding QRH summary.

R When a failure occurs, and after performing the ECAM actions, the PNF must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

R For dry and wet runways, the actual landing distance with failure is provided in the QRH. This actual landing distance is based on the following assumptions :

R – The approach speed is $V_{REF} + \Delta V_{REF}$ (refer to the "CRUISE" section of the Summary). The speed increment (when applicable), and corresponding landing distance penalty that are required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, is not taken into account.

R – The flight crew uses maximum reverse thrust on all operative reversers for wet runways.

R For contaminated runways, the landing distance factor that the PNF must apply to the actual landing distance with reverser, is also provided in the QRH. The PNF must refer to the applicable QRH page 4.03 and calculate the landing distance, taking into account the failure.

R Depending on the actual landing distance with failure, the PNF can decide whether or not a diversion is necessary.

APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PNF should refer to the "CRUISE" portion of the summary, to determine the V_{REF} correction, and **compute the VAPP**.

A V_{REF} table is provided in the summary, for failure cases leading to the loss of the MCDU.

The LANDING and GO-AROUND portions of the summary should be used for the **approach briefing**.

APPROACH

The APPR PROC actions should be performed by reading the APPROACH portion of the summary.

The PNF should then review the ECAM STATUS, and check that all the APPR PROC actions have been completed.

MAIN QRH CHANGES

For information related to the main QRH changes, refer to the "GENERAL INFORMATION" chapter in FCOM Volume 3 3.00.10.

631-1A	NOV2008	STD OPERATING PROCEDURES-2	ALL

THIS TABLE GIVES, FOR EACH AIRCRAFT INCLUDED IN THE MANUAL, THE CROSS REFERENCE BETWEEN :

- THE MANUFACTURING SERIAL NUMBER (MSN) WHICH APPEARS IN THE LIST OF EFFECTIVE PAGES
- THE REGISTRATION NUMBER OF THE AIRCRAFT AS KNOWN BY AIRBUS INDUSTRIE.

MSN	REGISTRATION
0009	S16UPT2H0

LOSS OF BRAKING

● IF AUTOBRAKE IS SELECTED :

– BRAKE PEDALS PRESS

● IF NO BRAKING AVAILABLE :

– REV MAX

– BRAKE PEDALS RELEASE

– A/SKID & N/W STRG OFF

– BRAKE PEDALS PRESS

– MAX BRK PR 1000 PSI

● If STILL NO BRAKING :

– PARKING BRAKE SHORT AND SUCCESSIVE APPLICATIONS

**GPWS ALERTS****CAUTION**

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.

During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops, or a safe trajectory is ensured.

■ "AVOID TERRAIN"

Simultaneously :

- AP OFF
 - PITCH PULL UP
- Pull to full backstick and maintain in that position.*
- THRUST LEVERS TOGA
 - SPEEDBRAKES lever CHECK RETRACTED
 - BANK WINGS LEVEL or ADJUST

● When flight path is safe, and the warning stops :

- Decrease pitch attitude and accelerate.

● When speed is above VLS, and vertical speed is positive :

- Clean up aircraft, as required.

■ "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP"

Simultaneously :

- AP OFF
 - PITCH PULL UP
- Pull to full backstick and maintain in that position.*
- THRUST LEVERS TOGA
 - SPEEDBRAKE lever CHECK RETRACTED
 - BANK WINGS LEVEL or ADJUST

● When the flight path is safe, and the warning stops :

- Decrease pitch attitude and accelerate.

● When speed is above VLS, and vertical speed is positive :

- Clean up aircraft, as required.

GPWS ALERTS (Cont'd)

■ **"TERRAIN TERRAIN" "TOO LOW TERRAIN"** :

Adjust the flight path, or initiate a go-around.

■ **"TERRAIN AHEAD"** :

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on an analysis of all available instruments and information.

■ **"SINK RATE" "DON'T SINK"** :

Adjust pitch attitude and thrust to silence the alert.

■ **"TOO LOW GEAR" – "TOO LOW FLAPS"** :

R

Perform a go-around.

■ **"GLIDE SLOPE"** :

Establish the aircraft on the glide slope, or switch OFF the G/S mode pushbutton, if flight below the glide slope is intentional (non precision approach (NPA)).

TCAS WARNINGS**■ Traffic advisory : "TRAFFIC" messages**

- Do not maneuver based on a TA alone.
- Attempt to see the reported traffic.

R ■ Resolution advisory : All "CLIMB" and "DESCEND" or "MAINTAIN VERTICAL SPEED MAINTAIN" or "ADJUST VERTICAL SPEED ADJUST" or "MONITOR VERTICAL SPEED" type messages

- AP (if engaged) OFF
- BOTH FDs OFF
- Respond promptly and smoothly to an RA by adjusting or maintaining the vertical speed, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

NOTE : Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between $V_{x\max}$ and V_{\max} .

- Respect stall, GPWS, or windshear warning.
- Notify ATC.
- When "CLEAR OF CONFLICT" is announced :
 - . Resume normal navigation in accordance with ATC clearance.
 - . AP/FD can be re-engaged as desired.

● GO AROUND procedure must be performed when an RA "CLIMB" or "INCREASE CLIMB" is triggered on final approach.

NOTE : Resolution Advisories (RA) are inhibited below 900 feet.

**ENG DUAL FAILURE – FUEL REMAINING**

As long as none of the engines recover, the flight crew must apply this paper procedure when required by the ECAM ENG DUAL FAILURE procedure. If time permits, clear ECAM alerts, and check the ECAM STATUS page.

LAND ASAP

- OPTIMUM RELIGHT SPD 300 KT
In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is :

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	– 4.5
60 000 kg/132 000 lb	– 3.5
70 000 kg/154 000 lb	– 2.5

At 300 knots, the aircraft can fly up to about 2 NM per 1000 feet (with no wind).

- LANDING STRATEGY DETERMINE
Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.
- VHF1/HF1 (◀)/ATC1 USE
- ATC NOTIFY

● IF NO RELIGHT AFTER 30 SEC :

- ENG MASTERS OFF 30 S/ON
Unassisted start attempts can be repeated until successful, or until APU bleed is available.

● IF UNSUCCESSFUL :

- CREW OXY MASKS (Above FL 100) ON

● WHEN BELOW FL 250

- APU (IF AVAIL) START

● WHEN BELOW FL 200

- WING ANTI ICE OFF
- APU BLEED ON
- ENG MASTERS (one at a time) OFF 30 S/ON

ENG DUAL FAILURE – FUEL REMAINING (CONT'D)

- When APU bleed is available or if engine restart is definitively considered impossible :

- OPTIMUM SPEED REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1000 kg)	At or below FL 200	FL 300	FL 400
78	241	251	261
76	237	247	257
72	229	239	249
68	221	231	241
64	213	223	233
60	205	215	225
56	197	207	217
52	189	199	209
48	181	191	201
44	173	183	193
40	165	175	185

At green dot speed, the aircraft can fly up to approximately 2.5 NM per 1000 feet (with no wind).

Average rate of descent is approximately 1600 feet/min.

- CABIN AND COCKPIT PREPARE
- CABIN SIGNS ON
- COMMERCIAL OFF
- USE RUDDER WITH CARE

- WHEN BELOW FL 150

- RAM AIR ON

APPROACH PREPARATION

NOTE : Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 800 feet/NM (with no wind).

- BARO SET
- CREW MASKS/OXY SUPPLY (below FL 100) OFF

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

■ IF FORCED LANDING ANTICIPATED

APPROACH

- FOR LDG USE FLAP 3
Only slats extend, and slowly.
- MIN APPR SPEED 150 KT
- VAPP DETERMINE
Vapp is the maximum between Vref + 25 knots / 150 knots :

Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	155	159	163	167	171	173

- At a suitable altitude (not below 3000 feet AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN) :

● When in CONF 3 and VAPP :

- GRAVITY GEAR EXTN handcrank PULL AND TURN
Disregard "USE MAN PITCH TRIM" on the PFD : The stabilizer is frozen due to insufficient hydraulic power.

● When L/G downlocked

- L/G lever DOWN
- APPROACH SPEED ADJUST
Adjust the speed to the determined Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 knots (max speed with slats extended).
- GND SPLR ARM
- MAX BRK PR 1000 PSI

AT 2000 FEET AGL

- CABIN NOTIFY FOR LANDING

AT 500 FEET AGL

- BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- ENG MASTERS OFF
- APU MASTER SW OFF
- BRAKES ON ACCU ONLY

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

AFTER LANDING**● When the aircraft has stopped :**

- PARKING BRK ON
 - ATC NOTIFY
 - FIRE pushbutton (ENG and APU) PUSH
 - AGENTS (ENG and APU) DISCH
- Engine Agent 2 is not available.*

■ If Evacuation required :

- EVACUATION INITIATE
 - ELT  CHECK EMITTING
- If not, switch on the transmitter.*

■ If Evacuation not required :

- CABIN CREW and PASSENGERS (PA) NOTIFY

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

■ IF DITCHING ANTICIPATED

APPROACH

- FOR LDG USE FLAP 3
Only slats extend, and slowly.
- MIN APPR SPEED 150 KT
- VAPP DETERMINE
VAPP is the maximum between Vref + 25 knots / 150 knots :

Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	155	159	163	167	171	173

● At a suitable altitude (not below 3000 feet AGL), configure the aircraft for ditching (CONF 3 ; L/G UP)

- L/G lever CHECK UP

AT 2000 FEET AGL

- CABIN NOTIFY FOR DITCHING
- DITCHING pushbutton ON
*In case of strong crosswind, ditch face to the wind.
In the absence of strong crosswind, prefer ditching parallel to the swell. Touchdown with approximately 11 degrees of pitch and minimum aircraft vertical speed.*

AT 500 FEET AGL

- BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- ENG MASTERS OFF
- APU MASTER SW OFF

AFTER DITCHING

- ATC (VHF 1) NOTIFY
- FIRE pushbutton (ENG and APU) PUSH
- AGENT (ENG and APU) DISCH
Engine Agent 2 is not available.
- EVACUATION INITIATE
- ELT ◁ CHECK EMITTING
If not, switch on the transmitter

**ENG DUAL FAILURE – NO FUEL REMAINING**

The flight crew must apply this paper procedure when required by the ECAM ENG DUAL FAILURE procedure. If time permits, clear ECAM alerts, and check the ECAM STATUS page.

- OPTIMUM SPEED 220 KT/GREEN DOT

Initially, fly 220 knots, because the PFD may not display the correct green dot speed. Then fly the green dot speed according to the following table :

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1000 kg)	At or below FL 200	FL 300	FL 400
68	221	231	241
64	213	223	233
60	205	215	225
56	197	207	217
52	189	199	209
48	181	191	201
44	173	183	193
40	165	175	185

At green dot speed, the aircraft can fly up to approximately 2.5 NM per 1000 feet (with no wind). Average rate of descent is approximately 1600 feet/min.

- LANDING STRATEGY DETERMINE

Determine whether a runway can be reached or the most appropriate place for a forced landing/ditching.

- VHF1/HF1 (if installed)/ATC1 USE

- ATC NOTIFY

- CREW OXY MASKS (Above FL 100) ON

- CABIN AND COCKPIT PREPARE

- SIGNS ON

- COMMERCIAL OFF

- USE RUDDER WITH CARE

● WHEN BELOW FL 150

- RAM AIR ON

APPROACH PREPARATION

NOTE : Final descent slope, when configured (CONF 3/L/G DOWN), will be approximately 800 feet/NM (with no wind).

- BARO SET

- CREW MASKS/OXY SUPPLY (below FL 100) OFF

**ENG DUAL FAILURE - NO FUEL REMAINING (Cont'd)****■ IF FORCED LANDING ANTICIPATED****APPROACH**

- FOR LDG USE FLAP 3
Only slats extend, and slowly.
- MIN APPR SPEED 150 KT
- VAPP DETERMINE
Vapp is the maximum between Vref+25 knots / 150 knots.

Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	155	159	163	167	171	173

- At a suitable altitude (not below 3000 feet AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN)

● When in CONF 3 and VAPP

- GRAVITY GEAR EXTN handcrank PULL AND TURN
Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.

● When L/G downlocked

- L/G lever DOWN
- APPROACH SPEED ADJUST
Adjust the speed to the determined Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 knots (max speed with slats extended).
- GND SPLR ARM
- MAX BRK PR 1000 PSI

AT 2000 FEET AGL

- CABIN NOTIFY FOR LANDING

AT 500 FEET AGL

- BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- ENG MASTERS OFF
- BRAKES ON ACCU ONLY

R

ENG DUAL FAILURE - NO FUEL REMAINING (Cont'd)**AFTER LANDING**

- When the aircraft has stopped :
 - PARKING BRK ON
 - ATC NOTIFY
- If Evacuation required :
 - EVACUATION INITIATE
 - ELT ◀ CHECK EMITTING
If not, switch on the transmitter
- If Evacuation not required :
 - CABIN CREW and PASSENGERS (PA) NOTIFY

IF DITCHING ANTICIPATED**APPROACH**

- FOR LDG USE FLAP 3
Only slats extend, and slowly.
- MIN APPR SPEED 150 KT
- VAPP DETERMINE
Vapp is the maximum between Vref+25 knots / 150 knots :

Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	155	159	163	167	171	173

- At a suitable altitude (not below 3000 feet AGL), configure the aircraft for ditching (CONF 3 ; L/G UP)
 - L/G lever CHECK UP

AT 2000 FEET AGL

- CABIN NOTIFY FOR DITCHING
- DITCHING pushbutton ON
In case of strong crosswind, ditch face to the wind.
In the absence of strong crosswind, prefer ditching parallel to the swell. Touchdown with approximately 11 degrees of pitch and minimum aircraft vertical speed.

AT 500 FEET AGL

- BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- ENG MASTERS OFF

AFTER DITCHING

- ATC (VHF 1) NOTIFY
- EVACUATION INITIATE
- ELT ◀ CHECK EMITTING
If not, switch on the transmitter

DITCHING

This procedure applies when engines are running. If engines are not running, refer to the QRH "ENG DUAL FAILURE" (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.

PREPARATION

- ATC/TRANSPONDER (if available) NOTIFY/AS RQRD
*Notify ATC of the nature of the emergency encountered, and state intentions.
If not in contact with ATC, select transponder code A7700, or transmit the distress message on : (VHF) 121.5 MHZ or (HF) 2182 KHZ or 8364 KHZ.*
- CABIN and COCKPIT PREPARE
Loose equipment secured ; survival equipment prepared ; belts and shoulder harness locked.
- GPWS SYS OFF
- GPWS TERR OFF
- R - SIGNS ON
- EMER EXIT LT ON
- COMMERCIAL OFF
- LDG ELEV SELECT 00
- BARO SET
Omit the normal approach and landing checklist.
- CREW MASKS/OXY SUPPLY (below FL100) OFF

APPROACH

- L/G lever UP
- SLATS and FLAPS MAX AVAIL

AT 2000 FEET AGL

- CAB PRESS MODE SEL CHECK AUTO
- BLEED (ENGs and APU) OFF
- CABIN NOTIFY FOR DITCHING
- DITCHING pushbutton ON
*In case of strong crosswind, ditch face to the wind.
In the absence of strong crosswind, prefer ditching parallel to the swell. Touchdown with approximately 11 degrees of pitch and minimum aircraft vertical speed.*

AT 500 FEET AGL

- R - BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- R - ENG MASTERS OFF
- R - APU MASTER SW OFF

AFTER DITCHING

- ATC (VHF 1) NOTIFY
- FIRE pushbutton (ENG and APU) PUSH
- AGENTS (ENG and APU) DISCH
- EVACUATION INITIATE

FORCED LANDING

This procedure applies when engines are running. If engines are not running, refer to the QRH "ENG DUAL FAILURE" (with or without fuel remaining) procedure, which has been amended to include the forced landing procedure, when the engines are not running.

PREPARATION

- ATC/TRANSPONDER (if available) NOTIFY/AS RQRD
*Notify ATC of the nature of the emergency encountered, and state intentions.
If not in contact with ATC, select transponder code A7700, or transmit the distress message on : (VHF) 121.5 MHZ or (HF) 2182 KHZ or 8364 KHZ.*
- CABIN and COCKPIT PREPARE
Loose equipment secured ; survival equipment prepared ; belts and shoulder harness locked.
- GPWS SYS OFF
- GPWS TERR OFF
- SIGNS ON
- EMER EXIT LT ON
- COMMERCIAL OFF
- LDG ELEV SET
- BARO SET
Omit normal approach and landing checklist.
- CREW MASKS/OXY SUPPLY (below FL100) OFF

APPROACH

- RAM AIR ON
- L/G lever DOWN
- SLATS AND FLAPS MAX AVAIL
- GND SPLR ARM
- MAX BRK PR 1000 PSI

AT 2000 FEET AGL

- CABIN NOTIFY FOR LANDING

AT 500 FEET AGL

- BRACE FOR IMPACT ORDER

AT TOUCHDOWN

- ENG MASTERS OFF
- APU MASTER SW OFF
- BRAKES ON ACCU ONLY

FORCED LANDING (Cont'd)

AFTER LANDING**● When aircraft has stopped :**

- PARKING BRK ON
- ATC (VHF1) NOTIFY
- FIRE pushbutton (ENG and APU) PUSH
- AGENTS (ENG and APU) DISCH

■ If Evacuation required :

- EVACUATION INITIATE

■ If Evacuation not required :

- CABIN CREW and PASSENGERS (PA) NOTIFY

EMER DESCENT

IMMEDIATE ACTIONS

- CREW OXY MASKS ON

The recommendation is to descend with the AP engaged :

- . Turn the ALT selector knob and pull
- . Turn the HDG selector knob and pull
- . Adjust the target SPD/MACH.

R - SIGNS ON

- THR LEVERS (if A/THR not engaged) IDLE

R R . If autothrust is engaged, check that THR IDLE is displayed on the FMA.

- . If not engaged, retard the thrust levers.

R - SPD BRK FULL

Extension of the speedbrakes will significantly increase Vls.

To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.

WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

- SPEED MAX/APPROPRIATE

CAUTION

Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.

Landing gear may be extended below 25 000 feet. In such a case, speed must be reduced to VLO/VLE.

NOTE : The recommendation is to descend with the autopilot engaged.

Use of the autopilot is also permitted in EXPEDITE mode (◀).

R - ENG MODE SEL IGN

- ATC NOTIFY

To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.

R - MAX FL 100/MEA

● IF CAB ALT > 14000 feet :

- PAX OXY MASKS MAN ON

R *Contact the cabin crew to confirm that the passenger oxygen masks are released.*

WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected either by the system or by pilot observation, apply the following recovery technique :

■ At takeoff

● If before V1

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

● If after V1

- THR LEVERS TOGA
- REACHING VR ROTATE
- SRS ORDERS FOLLOW

■ Airborne, initial climb or landing

- THR LEVERS AT TOGA SET OR CONFIRM
- AP (if engaged) KEEP
- SRS ORDERS FOLLOW

This includes the use of full back stick, if demanded.

NOTE: 1. If engaged, the autopilot disengages when α is greater than α_{prot} .
2. If the FD bars are not available, use an initial pitch attitude up to 17.5° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

- DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.
- CLOSELY MONITOR FLIGHT PATH AND SPEED.
- RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.

WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

W/S AHEAD red**■ Takeoff**

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

● Before takeoff

- Delay takeoff, or select the most favorable runway.

● During the takeoff run

- Reject takeoff.

NOTE: Predictive windshear alerts are inhibited above 100 knots until 50 feet.

● When airborne

- THR LEVERS TOGA

As usual, the slat/flap configuration can be changed, provided the windshear is not entered.

- SRS ORDERS FOLLOW

NOTE: If engaged, the autopilot disengages when α is greater than α_{prot} .

■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

NOTE: If a positive verification is made that no hazard exists, the warning may be considered cautionary.

- GO AROUND PERFORM

This includes the use of full backstick, if required.

NOTE: 1. If engaged, the autopilot disengages when α is greater than α_{prot} .

2. If the FD is not available, use a pitch initial attitude up to 17.5° . If necessary to minimize the loss of height, increase this pitch attitude.

W/S AHEAD amber

Apply precautionary measures, as indicated in the SUPPLEMENTARY TECHNIQUES 3.04.91.

WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

W/S AHEAD red

■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

- **Before takeoff**

- Delay takeoff, or select the most favorable runway.

- **During the takeoff run**

- Reject takeoff.

NOTE : Predictive windshear alerts are inhibited above 100 knots until 50 feet.

- **When airborne**

- THR LEVERS TOGA

As usual, the slat/flap configuration can be changed, provided the windshear is not entered.

- SRS ORDERS FOLLOW

NOTE : If engaged, the autopilot disengages when α is greater than α . prot.

■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

NOTE : If a positive verification is made that no hazard exists, the warning may be considered cautionary.

- THR LEVERS TOGA

- ANNOUNCE "GO AROUND-FLAPS"

- FLAPS RETRACT ONE STEP

- L/G UP SELECT

This includes the use of full backstick, if demanded.

NOTE : 1. If engaged, the autopilot disengages when α is greater than α . prot.

2. If the FD is not available, use a pitch initial attitude up to 17.5°. If necessary to minimize the loss of height, increase this pitch attitude.

W/S AHEAD amber

Apply precautionary measures, as indicated in the SUPPLEMENTARY TECHNIQUES 3.04.91.

CABIN OVERPRESSURE

Apply the following procedure (not displayed on ECAM) in case of total loss of the cabin pressure control leading to overpressure

- PACK 1 or 2 OFF
- BLOWER + EXTRACT OVRD
Cabin air is extracted overboard.
- ΔP FREQUENTLY MONITOR
- If $\Delta P > 9$ PSI
PACK 1 + 2 OFF
LAND ASAP

Before 10 minutes from landing :

- PACK 1 + 2 OFF
- BLOWER + EXTRACT AUTO

CAUTION

Check that ΔP is zero before opening the doors.

TOO HOT/COLD COCKPIT AND CABIN TEMPERATURE IN FLIGHT

Apply the procedure if the cockpit and cabin temperature become too hot or too cold with the temperature selector at its maximum cold or hot selection :

- PACKS OUTLET TEMP (ON ECAM BLEED PAGE) CHECK
- IF DIFFERENCE BETWEEN BOTH PACKS IS BELOW 10°C :
 - AIR COND HOT AIR switch OFF
A difference between both packs lower than 10°C may reflect a mixer temperature sensor failure. Switching OFF the HOT AIR results in the use of the duct temperature sensors only and no longer in the use of the mixer temperature sensors. A normal cabin and cockpit temperature will be recovered.
- IF DIFFERENCE BETWEEN BOTH PACKS IS AT OR ABOVE 10°C :
 - PACK (WITH THE HIGHEST OUTLET TEMP) OFF
A difference between both packs of 10°C or greater than 10°C may reflect a contamination of packs resulting in too hot cabin and cockpit air temperature. The situation may be alleviated by switching OFF the pack discharging the hottest air.

**AIR DUAL BLEED FAULT****■ If ENG 1 BLEED was lost due to a :**

LEAK on side 1

ENG 1 FIRE

Start Air Valve 1 failed open.

- DESCENT TO FL100/MEA INITIATE
Descend rapidly to FL100/MEA, to prevent excessive cabin altitude.

AVOID ICING CONDITIONS

■ If ENG 2 BLEED was lost due to a :

LEAK on side 2

ENG 2 FIRE

Start Air Valve 2 failed open.

- X BLEED CHECK CLOSED
- DESCENT TO FL225/MEA INITIATE
Descend rapidly to FL225, to recover the bleed supply from the APU.
- APU START
Start the APU during the descent.

● AT, OR BELOW, FL225 :

- WING A.ICE OFF
APU BLEED must not be used for wing anti-ice.
- APU BLEED ON

MAX FL225

AVOID ICING CONDITIONS

■ In all other cases :

- DESCENT INITIATE
Descend rapidly to FL225, so that the bleed supply may be supplied by the APU, if the bleed system recovery is not successful.

● If both packs are available :

If both packs are operative, it can be suspected that the second bleed system failed due to excessive demand. Recovery of the second failed engine bleed may be attempted.

■ If ENG 1 BLEED is lost first :

- PACK 1 OFF
- ENGINE 2 BLEED ON

■ If ENG 2 BLEED is lost first :

- PACK 2 OFF
- ENGINE 1 BLEED ON

**AIR DUAL BLEED FAULT (CONT'D)**

- If engine bleed recovery was not successful, or if one pack is inoperative :
 - X BLEED CHECK OPEN
 - DESCENT TO FL225/MEA CONTINUE
Descend rapidly to FL225, to recover the bleed supply from the APU.
 - APU START
Start the APU during the descent.

- AT, OR BELOW, FL225 :

- WING A.ICE OFF
APU BLEED must not be used for wing anti-ice.
 - APU BLEED ON
MAX FL225

AVOID ICING CONDITIONS

LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered :

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The “CAB PR LDG ELEV FAULT” message is displayed on the ECAM
- A “MAP NOT AVAIL” message may be displayed on one ND.

With respect to the Auto Flight System, and depending on when the flight plan is lost, the following two procedures list the actions to be performed, in their order of priority :

■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION

● When the system has recovered :

- Access the RAD NAV page, and manually tune the ILS (preferably using Ident). Enter the ILS course, if a frequency has been entered.
- Fly in selected speed.

NOTE : – LOC and G/S guidance modes are available.

- VLS speed is still available and displayed on the PFD.
- Missed approach trajectory is not available.

■ DESCENT or TERMINAL AREA

● When the system has recovered :

- Select the initial database
- Perform DIR TO a downpath waypoint. Select heading, if required.
- Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.
- Redefine the arrival and/or the approach procedure.
- Select the FUEL PRED page, and enter the GW.
- Activate the APPROACH phase.

Enter destination data on the PERF APPR page, as required.
Managed speed is available.

LOW ENERGY WARNING

R The "SPEED SPEED SPEED" synthetic voice is triggered every 5 seconds whenever the aircraft energy goes below a threshold under which thrust shall be increased.

R – "SPEED SPEED SPEED"

R Increase the thrust until the warning stops and, depending on the circumstances, adjust the pitch accordingly.

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on. In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

– CKPT DOOR CONT panel CHECK

This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).

- If two or more electrical latches (strikes) are faulty :

The cockpit door is not intrusion-proof.

The system may be recovered by performing the following steps :

– Cockpit door OPEN

– COCKPIT DOOR toggle switch SET to UNLOCK

After 10 seconds :

– COCKPIT DOOR door toggle switch SET to NORM

- If two pressure sensors are faulty :

Automatic latch release is not available, in case of cockpit decompression.

- If no LED on the CKPT DOOR CONT panel is on :

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically.

If it does not, consider using the mechanical override system to unlock the door.

LANDING WITH SLATS OR FLAPS JAMMED

– LANDING CONF CONF 3

■ Repeat the following until landing configuration is reached :

- SPEED SEL VFE NEXT – 5 KT
- Decelerate towards VFE NEXT – 5 KT, but not below VLS. If turbulence, the pilot may decide to decelerate to a lower speed (not below VLS) to avoid VFE exceedance.

NOTE : Autopilot may be used down to 500 feet AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.

- . Approach with selected speed is recommended.
- . A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- . VLS, displayed on the PFD, and OVERSPEED warning, are computed according to the actual flaps/slats position.
- . VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- . If VLS is greater than VFE NEXT (overweight landing), FLAPS lever can be set to the next required position while speed is reduced to follow VLS reduction, as surfaces extend. The VFE warning threshold should not be triggered.
- In this case, disconnect the A/THR. A/THR can be re-engaged when landing configuration is established.

As speed reduces through VFE NEXT :

– FLAPS LEVER ONE STEP DOWN

● When landing configuration is established :

- DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

FOR GO AROUND

The table on page 2.05 provides the MAX SPEEDS for abnormal configurations.

■ IF SLATS FAULT

● FOR CIRCUIT

- MAINTAIN SLAT/FLAP CONFIGURATION
- Recommended speed : MAX SPEED – 10 KT

● FOR DIVERSION

- SELECT CLEAN CONFIGURATION
- Recommended speed for flaps retraction is between MAX SPEED - 10 KT and MAX SPEED.
- Recommended speed : MAX SPEED – 10 KT

■ IF FLAPS FAULT

● FOR CIRCUIT

- MAINTAIN SLAT/FLAP CONFIGURATION
- Recommended speed : MAX SPEED – 10 KT

● FOR DIVERSION

- If Flaps jammed at 0**
- SELECT CLEAN CONFIGURATION

NOTE : Recommended speed for slats retraction is between MAX SPEED - 10 knots and max speed of actual slat/flap position.

- NORMAL OPERATING SPEEDS

- If Flaps jammed > 0**

- MAINTAIN SLAT/FLAP CONFIGURATION
- Recommended speed : MAX SPEED – 10 KT

NOTE : In case of go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

- . In some cases, MAX SPEED - 10KT may be a few knots higher than the VFE. In this situation, pilots may follow the VFE.

LANDING WITH SLATS OR FLAPS JAMMED (cont'd)

MAX SPEED							
Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3		
Slats							
R	S = 0	NO LIMITATION	215 kt	200 kt	185 kt	177 kt (Not allowed)	
	0 < S < 1	230 kt				177 kt	
R	S = 1	200 kt		200 kt	185 kt	177 kt	
	1 < S ≤ 3	177 kt		177 kt	177 kt		
S > 3	177 kt		177 kt	177 kt	177 kt	177 kt	

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to fuel flow indication.

As a guideline, determine the fuel consumption in clean configuration at same altitude without airspeed limitation (e.g. from ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to give the fuel consumption required to reach the destination in the current configuration.

**F/CTL RUDDER JAM**

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers.

This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals.

Use the ECAM F/CTL page for a visual check of the rudder position.

FOR APPROACH

– AVOID LANDING WITH CROSSWIND from the side where the rudder is deflected.

– MAX CROSSWIND FOR LDG 15 KT

R – AUTO BRK DO NOT USE

– FOR LANDING USE NORMAL CONF

– SPEED and TRAJECTORY STABILIZE ASAP

R – LDG DIST PROC APPLY
 R Refer to the QRH Part 2, or to the FCOM 3.02.80.

ON GROUND

– DIFFERENTIAL BRAKING USE ASAP

Do not use asymmetric thrust reverse.

Use nosewheel steering handle below 70 knots.

STABILIZER JAM

The system may not detect a stabilizer jam when the pitch trim wheel is jammed. The flight control normal law remains active in this case and there is no ECAM warning.

- AP OFF
- MAN PITCH TRIM CHECK

The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.

● IF MAN TRIM AVAIL :

- TRIM FOR NEUTRAL ELEV

If man pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).

APPR PROC

● IF MAN TRIM NOT AVAIL :

- FOR LDG USE FLAP 3
Do not select configuration full, so as not to degrade handling qualities.
- GPWS LDG FLAP 3 ON

R CAT 2 INOP

SIDESTICK/RUDDER PEDALS STIFF

R Even if the autopilot is disengaged, the sidesticks and/or the rudder pedals may be stiff. This R may affect either :

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

R The piloting technique remains the same : The aircraft remains responsive. However, the flight R crew should keep in mind that they may need to use extra force on the sidesticks and/or the R rudder pedals.

- AP DISENGAGEMENT CONFIRM

- CONSIDER TRANSFERRING CONTROL TO PNF

■ FOR DECRAB, ROLLOUT, OR ENGINE FAILURE

- BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

FUEL LEAK

- R A fuel leak may be detected, if :
- R . The sum of FOB and FU is significantly less than FOB at engine start, or is decreasing, or
 - R . A passenger observes fuel spray from engine/pylon or wing tip, or
 - R . The total fuel quantity decreases at an abnormal rate, or
 - R . A fuel imbalance develops, or
 - R . Fuel quantity of a tank decreases too fast (leak from engine/pylon, or hole in a tank), or
 - R . Fuel flow is excessive (leak from engine), or
 - R . Fuel is smell in the cabin.

R If visibility permits, leak source may be identified by a visual check from the cabin.

WHEN A LEAK IS CONFIRMED

LAND ASAP

■ LEAK FROM ENGINE/PYLON CONFIRMED :

- R Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.
- THR LEVER (of affected engine) IDLE
 - ENG MASTER (of affected engine) OFF
 - FUEL X FEED USE AS QRND
- R If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or R to enable use of fuel from both wings. Do not restart the engine.

■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED :

R Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine R if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding R line (case 2).

- FUEL X FEED MAINTAIN CLOSED
R The crossfeed valve must remain closed to prevent the leak from affecting both sides.
- CTR TK PUMP 1+2 OFF
R Each engine is fed via its associated inner tank only.
- INNER TANK FUEL QUANTITIES MONITOR
R Monitor the depletion rate of each inner tank.

FUEL LEAK (CONT'D)

■ CASE 1 : IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb) IN LESS THAN 30 MINUTES :

An engine leak may still be suspected. Therefore :

- THR LEVER (engine on leaking side) IDLE
- ENG MASTER (engine on leaking side) OFF
- CTR TK PUMP 1+2 ON
- FUEL LEAK MONITOR

● If leak stops :

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

- FUEL X FEED USE AS RQRD
- The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

● If leak continues (after engine shutdown) :

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

- ENGINE RESTART CONSIDER

CAUTION

Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.

■ CASE 2 : IF BOTH INNER TANKS DEPLETE AT A SIMILAR RATE :

A leak from the Center tank or the APU feeding line may be suspected.

● If fuel smell in the cabin :

- APU (if ON) OFF
- This prevents additional fuel loss through the APU feeding line.*

● When fuel quantity in one inner tank is less than 3 tons (6600 lb) :

- CTR TK PUMP 1+2 ON

R

FOR LANDING

CAUTION

Do not use reversers.

GRVTY FUEL FEEDING

– ENG MODE SEL IGN

AVOID NEGATIVE G FACTOR

● **DETERMINE GRAVITY FEED CEILING :**

R R Consult the following table to determine the flight altitude limitation.

Flight conditions at the time of gravity feeding	Gravity feed ceiling
Flight time above FL300 more than 30 minutes (Fuel deaerated)	Current FL*
Flight time above FL300 less than 30 minutes (Fuel non deaerated)	FL 300*
Aircraft flight level never exceeded FL300 (Fuel non deaerated)	FL150* or 7000 ft above takeoff airport, whichever is higher

* For JET B, gravity feed ceiling is FL100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● **WHEN REACHING GRVTY FEED CEILING :**

– FUEL X FEED OFF

● **IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING :**

If no fuel leak and for flight with only one engine running (this engine being fed by gravity), apply the following :

– FUEL X FEED ON
– BANK ANGLE . . 1 DEG WING DOWN ON LIVE ENGINE SIDE

– RUDDER TRIM USE

● **WHEN FUEL IMBALANCE REACHES 1 000 kg (2200 lbs) :**

– BANK ANGLE 2 or 3 DEG WING DOWN
ON LIVE ENG SIDE

FUEL IMBALANCE

– FOB CHECK

Compare the FOB+FU with the FOB at departure. If the difference is significant, or if the FOB+FU decreases, suspect a fuel leak.

CAUTION

A fuel imbalance may indicate a fuel leak.

Do not apply this procedure, if a fuel leak is suspected. Refer to the FUEL LEAK procedure.

– FUEL X FEED ON

● **On the lighter side and in the center tank :**

– FUEL PUMPS OFF

● **When fuel is balanced :**

– FUEL PUMPS (WING + CTR) ON

– FUEL X FEED OFF

DOUBLE AOA HEAT FAILURE

- If icing conditions cannot be avoided :
 - One of affected ADRs OFF
 - NAV ADR DISAGREE

DISPLAY UNIT FAILURE

- R ■ **DU is blank (with or without a large letter "F" in amber), or the display is distorted :**
- DU (affected) AS RQRD
The DU can be switched off.
 - ECAM/ND XFR (if ECAM DUs affected) USE
Transfer SD to the F/O or CAPT ND.
 - PFD/ND XFR (if EFIS DUs affected) USE
- R ■ **INVALID DISPLAY UNIT message is displayed :**
This may be caused by a DU failure.
- FOR AUTOMATIC DU RECOVERY . . WAIT MORE THAN 40s
- **IF DU IS AUTOMATICALLY RECOVERED :**
No crew action is required.
- **IF DU IS NOT RECOVERED :**
- Non-recovered DU AS RQRD
The DU can be switched off.
- **INVALID DATA message is displayed (not on all DUs) :**
- EIS DMC SWITCHING AS RQRD
- **IF UNSUCCESSFUL :**
- DU (affected) OFF THEN ON
- NOTE : ND display may disappear, in case too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover after about 30 seconds.*
- **INVALID DATA is displayed on all DUs :**
The autopilot, autothrust and MCDU navigation data, remain available.
- FOR AUTOMATIC DUs RECOVERY . . WAIT MORE THAN 40s
- **IF ALL DUs ARE AUTOMATICALLY RECOVERED :**
No crew action is required.
- **IF ONE OR MORE DUs ARE NOT RECOVERED :**
- Non-recovered DUs OFF FOR 40s.
 - Non-recovered DUs BACK ON sequentially
- **If the initial failure re-occurs (the INVALID DATA message appears on all DUs) when switching a given DU back ON :**
Apply the entire procedure again from the beginning. Leave this specific DU permanently OFF.
- **Inversion of EWD and SD :**
- ECAM UPPER DISPLAY OFF THEN ON
The action on the EIS DMC SWITCHING selector produces the same effect.

ECAM SINGLE DISPLAY

Only the EWD is available. No SD on the other DUs.

■ **To call a SYS page :**

- PRESS AND MAINTAIN the SYS page key on the ECP

■ **OVERFLOW ON THE STATUS page :**

- PRESS AND MAINTAIN the STS key on the ECP

The first page of the STATUS is displayed.

- RELEASE IT, THEN PRESS IT AGAIN WITHIN 2 SECONDS

The second page of the STATUS is displayed.

- CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS

When the STS key is released for more than 2 seconds, the EWD is displayed again.

RESIDUAL BRAKING PROC

■ IN FLIGHT :

- BRAKE PEDALS APPLY SEVERAL TIMES
Press the brakes pedals several times. This could zero a residual pressure on the alternate system.

● IF RESIDUAL PRESSURE REMAINS :

- A/SKID & N/W STRG selector KEEP ON

■ IF AUTOBRAKE IS AVAILABLE :

- FOR LANDING AUTO/BRK MED
Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels alternate pressure.

■ IF AUTOBRAKE IS NOT AVAILABLE :

- JUST AFTER TOUCHDOWN APPLY BRAKING
Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.
- Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

NOTE: *In case of taxi with deflated or damaged tires, refer to the TAXI WITH DEFLATED TIRES procedure (FCOM 3.01.32, page 2).*

L/G GRAVITY EXTENSION

- GRAVITY GEAR EXTN handcrank PULL AND TURN
Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.

- L/G lever DOWN

- GEAR DOWN indications (if available) CHECK

NOTE : 1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.

2. In the event of gravity extension caused by the failure of both LGCIUs, landing gear position indications on the ECAM are lost. LDG GEAR lights on the LDG control panel remain available, if LGCIU1 is electrically-supplied.

3. The LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.

4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

■ If successful :

Do not reset the free-fall system : This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

NOTE : The free-fall system may be reset in flights used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed.

The flight crew should not reset the free-fall system on the ground after flight.

■ If unsuccessful :

- LDG WITH ABNORMAL L/G procedure APPLY

ASYMMETRIC BRAKING

Normal braking is faulty, or the green hydraulic system is in low pressure, and all brakes of one gear are released.

- Apply brake progressively on the available side. Counter swing with the rudder.
- Avoid crosswind in excess of 10 knots from the side of the available brake.

● If only one reverse is available :

- Do not use Reverse on the side of the available brake.
- LDG DIST PROC APPLY

● In case of NORM BRK FAULT, multiply the landing distance by :

- 2.35 on dry runway,
- 1.85 on wet runway,
- 1.90 on contaminated runway

● In case of G SYS LO PR, multiply the landing distance by :

- 2.50 on dry runway,
- 2.25 on wet runway,
- 2.75 on contaminated runway.

LDG WITH ABNORMAL L/G

PREPARATION

- CABIN CREW NOTIFY
- ATC NOTIFY
- GALLEY OFF
 - . Consider fuel reduction to a safe minimum.

● If NOSE L/G abnormal :

- CG location (if possible) AFT
 - . 10 PAX from front to rear moves the CG roughly 4 % aft.
 - . 10 PAX from mid to rear moves the CG roughly 2.5 % aft.

● If one MAIN L/G abnormal :

- FUEL IMBALANCE CONSIDER
 - . Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.
- OXYGEN CREW SUPPLY OFF
- SIGNS ON
- CABIN and COCKPIT PREPARE
 - . Loose equipment secured
 - . Survival equipment prepared
 - . Belts and shoulder harness locked.

APPROACH

- GPWS SYS OFF
- L/G LEVER CHECK DOWN
- GRVTY GEAR EXTN handcrank TURN BACK TO NORMAL
- AUTOBRAKE DO NOT ARM
- EMER EXIT LT ON
- CABIN REPORT OBTAIN
- A/SKID & N/W STRG OFF
- MAX BRAKE PR 1000 PSI

● If one or both MAIN L/G abnormal :

- GROUND SPOILERS DO NOT ARM

BEFORE LANDING

- RAM AIR ON
- BRACE FOR IMPACT ORDER

● If the external light condition is poor at landing :

- DOME LT DIM

Cont'd

LDG WITH ABNORMAL L/G (cont'd)**FLARE, TOUCHDOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls. Engine pumps continue to supply adequate hydraulic pressure for 30 seconds after first engine shutdown.

- REVERSE DO NOT USE

● If NOSE L/G abnormal

- NOSE MAINTAIN UP
After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose onto the runway before elevator control is lost.
- BRAKES (compatible with elevator efficiency) APPLY
- ENG MASTERS OFF
Shutdown the engines before nose impact.

● If one MAIN L/G abnormal

- ENG MASTERS OFF
At touchdown, shut down both engines.
- FAILURE SIDE WING MAINTAIN UP
Use roll control, as necessary, to maintain the unsupported wing up as long as possible.
- DIRECTIONAL CONTROL MAINTAIN
Use rudder and brakes (maximum 1000 psi) to maintain the runway axis as long as possible.

● If both MAIN L/G abnormal

- ENG MASTERS OFF
Shutdown the engines in the flare, before touchdown.
- PITCH ATTITUDE (at touchdown) NOT LESS THAN 6°

WHEN A/C STOPPED

- ENG (all) and APU FIRE pushbutton PUSH
Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.
- ENG (all) and APU AGENT DISCH

■ If Evacuation required :

- EVACUATION INITIATE
All emergency and passenger doors may be used to evacuate the aircraft. Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton, if installed.

■ If Evacuation not required :

- CABIN CREW and PASSENGERS (PA) NOTIFY
Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).

INTENTIONALLY LEFT BLANK

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted :

MEMORY ITEMS

- AP/FD OFF
- A/THR OFF
- PITCH/THRUST :
 - Below THRUST RED ALT 15°/TOGA
 - Above THRUST RED ALT and Below FL 100 10°/CLB
 - Above THRUST RED ALT and Above FL 100 5°/CLB
- FLAPS Maintain current CONFIG
- SPEEDBRAKES Check retracted
- L/G UP

- When at, or above MSA or Circuit Altitude :

- Level off for troubleshooting

- GPS ALTITUDE Display on MCDU

- To level off for troubleshooting :

- | | |
|---|-------------------|
| R | – AP/FD OFF |
| R | – A/THR OFF |

NOTE : Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.

PITCH / THRUST FOR INITIAL LEVEL OFF

SLATS / FLAPS EXTENDED		Above 67 t	67 t - 57 t	Below 57 t
CONF	Speed	Pitch (°) / Thrust (% N1)		
3	F	7.0 / 62.4	7.0 / 58.4	7.0 / 53.0
2	F	8.5 / 62.3	8.5 / 58.3	8.5 / 53.0
1+F	S	4.5 / 61.3	4.5 / 57.2	4.5 / 52.3
1	S	7.5 / 60.2	7.5 / 55.8	7.5 / 51.0
CLEAN				
FL	Speed	Pitch (°) / Thrust (% N1)		
Below FL 200	250 kts	3.5 / 64.7	3.0 / 62.3	2.0 / 60.3
FL 200 – FL 320	275 kts	2.5 / 78.7	2.0 / 76.8	1.0 / 75.3
Above FL 320	M 0.76	3.0 / 84.6	2.5 / 83.3	2.0 / 80.8

**UNRELIABLE SPEED INDICATION/ADR CHECK PROC (CONT'D)****Flying technique to stabilize speed :**

- Adjust pitch in order to fly the required flight path.
- When target pitch is reached, flying intended flight path, adjust thrust to target :
 - If the aircraft pitch tends to increase, aircraft is slow, then increase thrust ;
 - If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.

WHEN FLIGHT PATH IS STABILIZED

- PROBE/WINDOW HEAT ON

Technical recommendations :

- Respect Stall Warning
- To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations

● If remaining altitude indication is unreliable :

- Do not use FPV and/or V/S, which are affected.
- ATC altitude is affected. Notify the ATC.
- Refer to GPS altitude : altitude variations may be used to control level flight, and is an altitude cue.
- Refer to Radio Altimeter.

CAUTION

If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5%. Fuel flow will increase by about 27%.

UNRELIABLE SPEED INDIC/ADR CHECK PROC (CONT'D)**Affected ADR identification :**

- Crosscheck all speed indications and refer to QRH 4.01 (for F, S speeds) or 5.01 (for speed in clean conf) :

■ If at least one ADR is reliable :

- Faulty ADR(s) OFF
 - REMAINING AIR DATA CONFIRM
- Alternates sources may be used to evaluate the air data :*
- GPS altitude
 - GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ If affected ADR(s) cannot be identified or all ADRs are affected :

- ONE ADR KEEP ON
- Keep one ADR ON to maintain the STALL WARNING protection*
- TWO ADRs OFF
- This prevents the flight control laws from using two coherent but unreliable ADR data.*
- LDG CONF USE FLAP 3
- APP SPD VLS + 10
- LDG DIST PROC APPLY

R *Multiply the landing distance by 1.45 on dry runways, by 1.4 on wet runways, or by 1.3 on contaminated runways.*

■ To return to departure airport :

Keep takeoff configuration preferably
Refer to initial and intermediate approach, and final approach tables.

■ To accelerate and clean up after takeoff :

Accelerate and clean up the aircraft in level flight :

- THRUST CLB
- FLAPS RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (refer to the "Pitch/Thrust for initial level off" table).

Once in clean configuration, refer to climb, cruise, descent, approach tables for flight continuation.

■ Other cases :

Refer to climb, cruise, descent, approach tables for flight continuation.

R **UNRELIABLE SPEED INDICATION/ADR CHECK PROC (CONT'D)**

CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t - 57 t	Below 57 t

R UNRELIABLE SPEED INDICATION/ADR CHECK PROC (CONT'D)

INITIAL AND INTERMEDIATE APPROACH IN LEVEL FLIGHT

R The approach phase between Green Dot speed (clean configuration) and the landing configuration (CONF 3), is flown in level flight.

R **LANDING GEAR UP IN LEVEL FLIGHT**

		Above 67 t	67 t - 57 t	Below 57 t
CONF	Speed (kts)	Pitch (°)/Thrust (% N1)		
0	G-DOT	5.0 / 58.7	5.0 / 54.4	5.5 / 50.0
1	S	7.5 / 60.3	7.5 / 56.0	7.5 / 51.2
1+F (a)	S	4.5 / 61.3	4.5 / 57.2	4.5 / 52.3
2	F	8.5 / 62.2	8.5 / 58.4	8.5 / 53.0

**LANDING GEAR DOWN IN LEVEL FLIGHT
(EXPECT GRVITY EXTENSION)**

3	F	7.0 / 67.7	7.0 / 63.3	7.5 / 58.6
---	---	------------	------------	------------

- (a) Due to the fact that the speed is unreliable, the SFCC may select the 1+F configuration in approach, instead of 1.

FINAL APPROACH AT STANDARD – 3° DESCENT FLIGHT PATH**LANDING GEAR DOWN**

		Above 67 t	67 t - 57 t	Below 57 t
CONF	Speed (kts)	Pitch (°)/Thrust (% N1)		
3	VLS+10	4.0 / 49.7	4.0 / 45.8	4.0 / 42.1

Flying technique to stabilize speed :

- Adjust pitch in order to fly the required flight path.
- When target pitch is reached, flying intended flight path, adjust thrust to target.
 - If the aircraft pitch tends to increase, aircraft is slow, then increase thrust ;
 - If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.

NAV FM/GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude :

- 0.5 minutes for latitudes below 55 deg
- 0.9 minutes for latitudes at, or above, 55 deg and below 70 deg
- or a latitude threshold of 0.5 minutes, regardless of the latitude.

- A/C POS CHECK

R The following procedure is not displayed on the ECAM:

● If the message occurs during ILS/LOC approach (LOC green):

- DISREGARD it.

● If the message occurs in climb, cruise, or descent:

- CHECK navigation accuracy, using raw data:

■ If the check is positive:

- NAV mode and ND ARC/ROSE NAV may be used.

■ If the check is negative:

- HDG/TRK mode and raw data must be used.
- Consider switching off the terrain functions of the GPWS.
- When possible, compare the FM position with the GPIRS position, on the POSITION MONITOR page:

■ If one FM position agrees with the GPIRS position, on the POSITION MONITOR page:

- Use the associated FD/AP.

■ If not:

- Deselect the GPS, and revert to basic information.

● If the message occurs during a Non Precision Approach (NPA):

■ Overlay approach:

- SELECT HDG or TRK, and use raw data

■ GPS or RNAV approach:

- GO AROUND or fly visual, if visual conditions are met.

**ADR 1+2+3 FAULT**

This procedure is not displayed on the ECAM. Only dual ADR warnings are displayed, in case of a triple ADR failure.

- ADR (all) OFF
- STBY INST (ALT + ASI) USE

NOTE : Disregard ECAM actions for AIR DATA SWTG and ATC, since these have no effect in case of a total loss of ADRs.

F/CTL ALTN LAW (PROT LOST)

- MAX SPEED 320/.82
See the following table for the IAS/M relationship for .82.

FL	390	370	350	330	310	290	280 and below
MAX SPD	252	265	278	290	305	315	320

- WHEN L/G DN : DIRECT LAW

At landing gear extension, control reverts to direct law in pitch, as well as in roll.

NOTE : Use manual control of cabin pressurization (Refer to 3.02.21) :

- MODE SEL MAN
- MAN V/S CTL AS RQD

ADR 1+2+3 FAULT (CONT'D)

STATUS

MAX SPEED 320/82
RUD WITH CARE ABV 160 KT

At slats' extension, full rudder travel authority is recovered.

APPR PROC :

- FOR LDG USE FLAP 3
- GPWS LDG FLAP 3 ON
- APPR SPD VREF + 10 KT
- LDG DIST PROC APPLY

Multiply the landing distance by 1.35 on dry runway, or 1.30 on wet runway, or 1.25 on contaminated runway.

● FOR L/G GRVTY EXTN (not on the ECAM) :

- GRVTY GEAR
 - EXTN handcrank PULL AND TURN
 - L/G LEVER DOWN
- WHEN L/G DN : DIRECT LAW

● DURING FINAL APPR

- V/S CTL FULL UP

INOP SYS
ATT LIMIT
OVSP LIMIT
ALPHA LIMIT
ADR 1+2+3
WINDSHEAR DET
RUD TRV LIM 1+2
A/THR
AP 1+2
GPWS

Other inop sys :
See below

NOTE 1 : In case of a go-around, respect maximum speed 215 knots in CONF 1+F, due to the loss of flap auto retraction to CONF 1.

CAUTION

Check that the outflow valve is fully open, and that cabin altitude is at airfield elevation before opening the doors.

Other inoperative systems

CAB PR 1+2
RAT auto extension

ATC ALTI MODE

TCAS 
L/G RETRACT

NAV IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on the PFD and red HDG flag on the ND).

Aircraft attitude and heading may be recovered by applying the following procedure. The aircraft must stay level, with constant speed for 30 seconds.

- MODE SELECTOR ATT
- ALIGN light on for 30 seconds.
- ATT MODE displayed on the CDU.
- LEVEL A/C ATTITUDE HOLD
- CONSTANT A/C SPEED MAINTAIN
- DISPLAY SYS switch AFFECTED SYS
- DISPLAY DATA switch HDG

■ MCDU INITIALIZATION :

- DATA (MCDU KEY) PRESS
The DATA INDEX page is displayed.
- IRS MONITOR (2L KEY) PRESS
The IRS MONITOR page is displayed.
- A/C HEADING ENTER
The heading must be entered in the SET HDG field (5R KEY).

■ CDU INITIALIZATION :

Depending on the CDU keyboard installed, an "H" may be written on the "5" key :

■ If "H" is written on the "5" key :

- H KEY PRESS
Degree marker, 0 decimal point, ENT and CLR lights come on.
- A/C HEADING ENTER

■ If "H" is not written on the "5" key :

- A/C HEADING ENTER
Enter the aircraft's magnetic heading on the CDU keyboard.
Then, press the ENT key to enter data.
Example : To enter a heading of 320°, dial 3, 2, 0, 0 then press ENT.
Heading will be displayed on the associated ND.
"HDG---ATT MODE" will be displayed on the CDU.
Due to IR drift, the magnetic heading has to be periodically crosschecked and updated with standby compass, if required.

ENG RELIGHT (in flight)

- MAX ALTITUDE See below
- ENG MASTER affected) OFF
- THR LEVER (affected) IDLE
- ENG MODE SEL IGN
- X BLEED OPEN
- WING A. ICE (for starter assist) OFF
- ENG MASTER (affected) ON

Be aware that, contrary to an autostart on ground, the crew must take appropriate action in case of an abnormal start.

Engine light-up must be achieved within 30 seconds after fuel flow increases.

- ENG PARAMETERS (N2, EGT) CHECK

If the START FAULT ENG STALL warning is triggered, although engine parameters are normal, disregard the warning.

■ When idle reached :

- ENG MODE SEL NORM
- TCAS MODE SEL ◀ check TA/RA

Check that the selector is at TA/RA since, if the ENG SHUT DOWN procedure has been applied, the TCAS mode selector may have been set at the TA position.

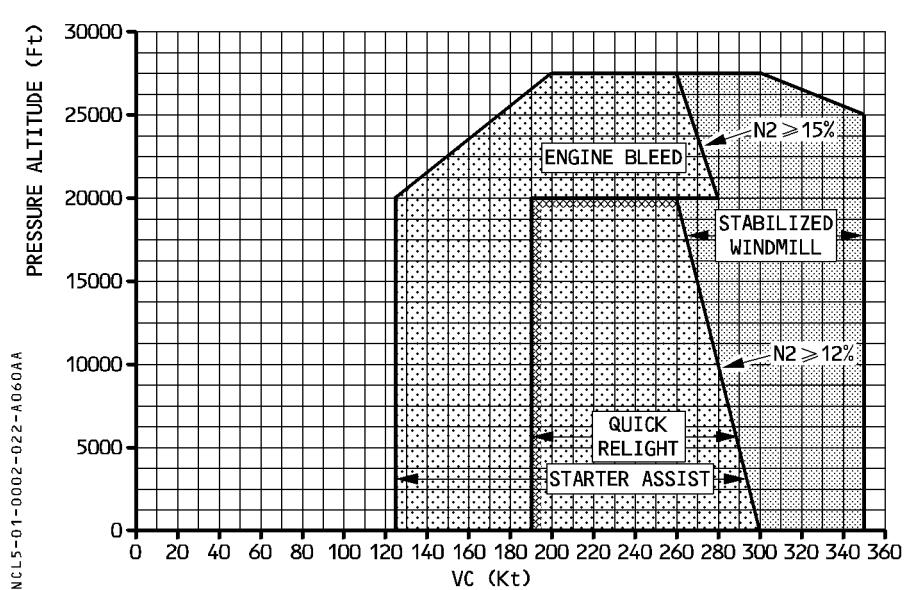

- Affected SYS RESTORE

■ If no relight :

- ENG MASTER (affected) OFF

Wait 30 seconds before attempting a new start (to drain the engine).

IN FLIGHT ENGINE RELIGHT ENVELOPE

ENG 1(2) STALL

■ N2 between 50 % and IDLE :

- ENG MASTER (affected engine) OFF
- ENG 1 (2) SHUT DOWN**

■ N2 above IDLE (title and procedure not displayed on ECAM) :**● On ground :**

- ENG MASTER (affected engine) OFF

● In flight :

- THR LEVER (affected engine) IDLE
- ENG PARAMETERS (affected engine) CHECK

● Abnormal

- ENG MASTER (affected engine) OFF

ENG 1 (2) SHUT DOWN**● Normal :**

- ENG A.ICE (affected engine) ON
- WING A.ICE ON
- THR LEVER (affected engine) SLOWLY ADVANCE

● If a stall recurs :

- THR LEVER (affected engine) REDUCE

● If a stall does not recur :

Continue engine operation.

R

ENG TAILPIPE FIRE

CAUTION

External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :

- MAN START OFF
- ENG MASTER (affected) OFF
- AIR BLEED PRESS ESTABLISH
- BEACON ON
- ENG MODE SEL CRANK
- MAN START ON

● When burning has stopped :

- MAN START OFF
- ENG MODE SEL NORM

HIGH ENGINE VIBRATION

The ECAM's VIB advisory ($N1 \geq 6$ units, $N2 \geq 4.3$ units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

VIB detection alone does not require engine shutdown.

- NOTE :
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
 2. High $N1$ vibrations are generally accompanied by perceivable airframe vibrations.
High $N2$ vibrations can occur without perceivable airframe vibrations.

■ If no icing conditions :

- ENG PARAMETERS CHECK
Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.

● If rapid increase above the advisory :

- THRUST LEVER (affected engine) RETARD
Flight conditions permitting, reduce $N1$ to maintain the vibration level below the advisory threshold.
- Note : If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.

■ If icing conditions :

An increase in $N1$ vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

- A/THR OFF
- ENGINE ANTI-ICE CHECK

If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30-second interval.

- THRUST LEVER (one engine at a time) .. INCREASE THRUST
Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration.
Resume normal operation.

NOTE : When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.

OVERWEIGHT LANDING

– LDG CONF AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance.*
- If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.*

In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

R
R
R
R
NOTE : For weights greater than 70000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 knots). Consequently, on the FCU, the crew must select a speed below 200 knots before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

– LDG DIST CHECK

– PACK 1 and 2 OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines, in the event of a go-around.

● In the final approach stages

– TARGET SPEED VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.

Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

– REVERSE THRUST USE MAX AVAILABLE

● After nosewheel touchdown

– BRAKES APPLY AS NECESSARY

Maximum braking may be used after nosewheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

– BRAKE FANS (◀) ON

Be prepared for tire deflation, if temperatures exceed 800° C.

OAT °C	MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1000 kg)							
	AIRPORT ELEVATION (FT)							
0	2000	4000	6000	8000	10000	12000	14000

50	78	72						
55								

**COCKPIT WINDSHIELD/WINDOW CRACKED**

- MAX FL 230
- CAB PRESS MODE SEL MAN
- MAN V/S CTL AS RQRD

Set the cabin altitude, according to the table below.

ΔP =	FL	100	150	200	230
5 PSI	CABIN ALTITUDE	0	3000	6000	8000

● When starting the final descent :

- CAB PRESS MODE SEL AUTO

Note : If sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin :

- CAB PRESS MODE SEL MAN
- MAN V/S CTL FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

COCKPIT WINDSHIELD/WINDOW ARCING

- Affected WINDOW/WINDSHIELD ANTI ICE C/B PULL

In case of electrical arcing, pull the circuit breaker of the affected window/windshield heating system :

- | | |
|-----------------------------|------------------------------|
| . ANTI ICE L WSHLD C/B AF10 | . ANTI ICE WINDOWS L C/B X14 |
| . ANTI ICE R WSHLD C/B AF03 | . ANTI ICE WINDOWS R C/B W14 |

VOLCANIC ASH ENCOUNTER

Accomplish the following, while making a 180° turn.

- ATC NOTIFY
- A/THR OFF
- THRUST (conditions permitting) DECREASE
- CREW OXYGEN MASKS ON/100%
- CABIN CREW NOTIFY
- PASSENGER OXYGEN AS RQD
- ENG ANTI ICE ON
- WING ANTI ICE ON
- PACK FLOW HI
- APU START
- ENGINE PARAMETERS MONITOR
- AIRSPEED INDICATIONS MONITOR

If airspeed is unreliable or lost, use the UNRELIABLE SPEED INDICATION/ADR CHECK PROC procedure (2.15).

1. If both engines flame out and speed indications are lost, use the DUAL ENGINE FAILURE procedure (1.16) to get the optimum relight speed.
 - . In case of engine failure, switch off the wing anti-ice before engine restart.
2. If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin :
 - CAB PRESS MODE SEL MAN
 - MAN V/S CTL FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

BOMB ON BOARD

IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.

If it is not possible to land and evacuate the aircraft within 30 minutes, apply the following procedures :

COCKPIT PROCEDURES

Background

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2500 feet difference between the aircraft and the cabin altitude.

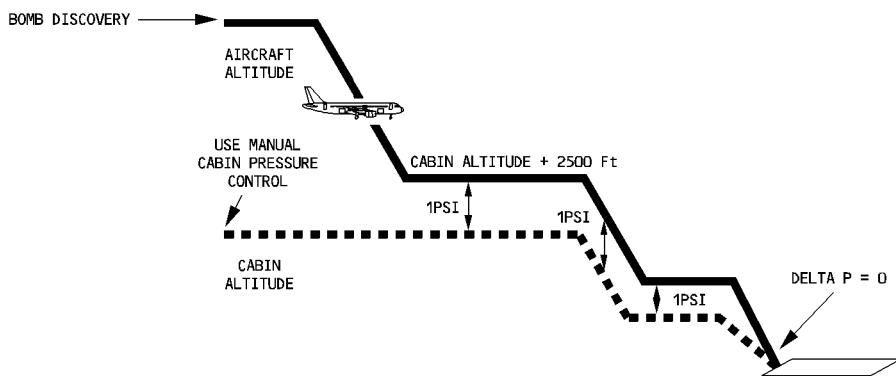

These conditions are achieved by using the manual pressure control.

Procedure

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2500 feet and maintain delta P at 1 PSI.
- During further steps of descent, maintain delta P at 1 PSI.
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

**BOMB ON BOARD (Cont'd)**

- AIRCRAFT (if climbing) LEVEL OFF
- CABIN PRESS MODE SEL MAN
- CAB ALT MAINTAIN
- CABIN CREW NOTIFY
- ATC/COMPANY OPERATIONS NOTIFY
- FUEL RESERVES DETERMINE

Keep in mind that when flying at cabin altitude + 2500 feet, the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.

- NEXT SUITABLE AIRPORT DETERMINE
- FCU SPEED SELECTION KNOB PULL AND TURN

Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.

- DESCENT TO CAB ALT + 2500 FEET or MEA or minimum obstacle clearance altitude INITIATE
- AVOID SHARP MANEUVERS
- CAB ALT MAINTAIN

● When at CAB ALT + 2500 FEET :

- 1 PSI DELTA P MAINTAIN
- GALLEY OFF

● When the bomb is secured at the LRBL :

- EMER EXIT LT ON
 - COMMERCIAL OFF
 - FLAPS (fuel permitting) AT LEAST CONF 1
- For landing, use normal configuration.*

- LANDING GEAR
(fuel permitting, except for flight over water) DOWN

● For any other steps of descent :

- 1 PSI DELTA P MAINTAIN

● During approach :

- CABIN PRESS MODE SEL AUTO

● When aircraft on ground and stopped in a remote area (if possible) :

■ If evacuation required :

- EVACUATION INITIATE
- Avoid exits, and exiting on the same side as the bomb or near the bomb.*

■ If evacuation not required :

- CABIN CREW and PASSENGERS (PA) NOTIFY

BOMB ON BOARD (Cont'd)

CABIN PROCEDURES

If a suspect device is found in the cabin :

WARNING

Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.

WARNING

Alternate locations must not be used without consulting with an aviation explosives security specialist. **Never take a suspect device to the flight deck.**

CAUTION

The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

- EOD PERSONNEL ON BOARD **CHECK**

Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.

- BOMB **DO NOT OPEN, DO NOT CUT WIRES,
SECURE AGAINST SLIPPING, AVOID SHOCKS**

Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.

- PASSENGERS **LEAD AWAY FROM BOMB**

Move passengers at least 4 seat rows away the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.

Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.

Service items may need to be collected in order to secure tray tables.

- PORTABLE ELECTRONIC DEVICES **SWITCH OFF**

The cabin crews must command passengers to switch off all portable electronic devices.

- BOMB **CHECK NO ANTI-LIFT DEVICE**

To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.

If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.

If a card is used an can be slid under the bomb, leave it under the bomb and move together with the bomb.

If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.

**BOMB ON BOARD (Cont'd)****R – EMERGENCY EQUIPMENTS REMOVE AND STOW**

Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.

R – GALLEY/IFE POWER OFF

All galley and IFE equipments located close to the LRBL must be switched off.

R ● If the bomb can be moved :**R – RH AFT CABIN DOOR SLIDE DISARM****R – LEAST RISK BOMB LOCATION (LRBL) PREPARE**

Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.

On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.

Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.

CAUTION

DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

R – BOMB INDICATION LINE POSITION

NOTE : *A bomb location indicator line is a 6- to 8- foot (1.8 to 2.4 m) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.

R – BOMB MOVE TO LRBL

Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.

CAUTION

Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

R – LEAST RISK BOMB LOCATION (LRBL) COMPLETE

Place an additional single thin sheet of plastic over the bomb.

CAUTION

DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

BOMB ON BOARD (Cont'd)

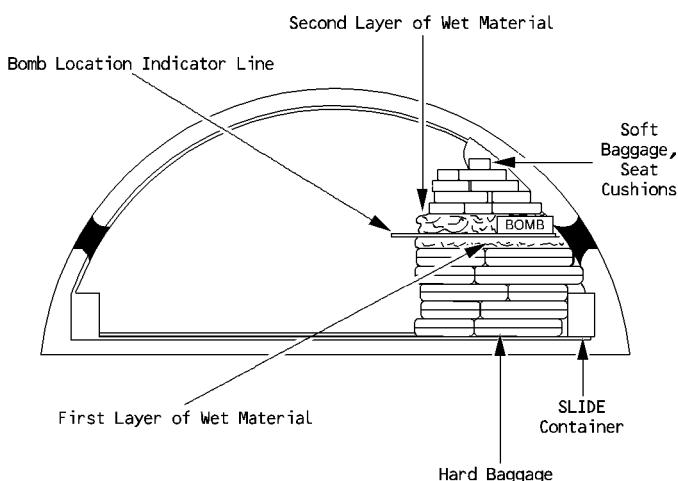

Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb. DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water or any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

LRBL STACK

NCL5-03-0002-030A001AA

- PASSENGERS MOVE/ADVISE

Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.

Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.

- CABIN CREW NOTIFY COCKPIT CREW

Cabin crew notify the flight crew that the bomb is secured at the LRBL.

- EVACUATION/DISEMBARKATION EXECUTE

Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".

Use all available airport facilities to disembark without delay.

R **VAPP Calculation in the case of an ABNORMAL/EMERGENCY Configuration**

$$\boxed{\text{VAPP} = \text{VREF} + \Delta\text{VREF} + \text{APPR COR}}$$

R =

VREF											
Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78
VREF (KT) = VLS CONF FULL	CG < 25% 108	113	118	123	127	132	136	140	144	148	150
	CG ≥ 25% 106	111	116	121	125	130	134	138	142	146	148

(b) The landing distance coefficients for wet or contaminated runways assume the use of maximum reverse thrust on all of the operative reversers. Apply these coefficients to the actual landing distance with reversers.

(c) The applicable landing configuration (CONF 1 or CONF 3) is displayed on the ECAM STATUS page.

* See below for multiple failures

USE OF THE TABLE (PREVIOUS PAGES)

- $\Delta VREF$ values take into account the necessary corrections, due to failures and the required landing configuration. The $\Delta VREF$ values are rounded off to take into account all possible weight ranges.

LDG DIST factors must be applied to the actual "LANDING DISTANCE WITHOUT AUTOBRAKE-CONFIGURATION FULL" (Refer to QRH 4.03).

- For a single failure :

- . Determine the LDG CONF to be selected
- . Determine the $\Delta VREF$
- . $VAPP = VREF + \Delta VREF + WIND CORRECTION$ (Refer to QRH 2.31).
- . Determine the LDG DIST factor.

- For multiple failures :

- . Only combine PRIMARY or SINGLE failures. In the case of a PRIMARY failure, the associated effects of SECONDARY(s) failure are taken into account by the $\Delta VREF$ and LDG DIST factor computation.
- . Use the lowest LDG CONF
- . Use the highest $\Delta VREF$ to compute the VAPP.
- . Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (*). If all values are marked with an asterisk, use the highest LDG DIST factor.

- R . Examples Applicable to Dry Runways :

FLAPS FAULT (F < 3, S ≥ 1)	LDG CONF 3	$\Delta VREF = 10 \text{ KT}$	$\text{LDG DIST} \times 1.40^*$
BRK ANTI SKID	LDG CONF FULL	$\Delta VREF = 0$	$\text{LDG DIST} \times 1.75$
TOTAL	LDG CONF 3	$\Delta VREF = 10 \text{ KT}$	$\text{LDG DIST} \times 2.45$

$$\begin{aligned} \text{VREF} = 131 \text{ KT} \rightarrow \text{VAPP} &= 131 + 10 + \text{WIND (10 KT MAX)} \\ &= 141 \text{ KT} + \text{WIND (10 KT MAX)} \end{aligned}$$

ALTN LAW	LDG CONF 3	$\Delta VREF = 10 \text{ KT}$	$\text{LDG DIST} \times 1.35^*$
FLAPS FAULT (F < 1, S ≥ 1)	LDG CONF 3	$\Delta VREF = 25 \text{ KT}$	$\text{LDG DIST} \times 1.95^*$
TOTAL	LDG CONF 3	$\Delta VREF = 25 \text{ KT}$	$\text{LDG DIST} \times 1.95$

$$\begin{aligned} \text{VREF} = 140 \text{ KT} \rightarrow \text{VAPP} &= 140 + 25 + 0 \text{ (No wind correction)} \\ &= 165 \text{ KT} \end{aligned}$$

**TRIPPED C/B REENGAGEMENT**

R In flight, do not reengage a circuit breaker (C/B) that has tripped by itself,
 R unless the Captain judges it necessary to do so for the safe continuation
 R of the flight. This procedure should be adopted only as a last resort, and
 R only one reengagement should be attempted.

R On ground, do not reengage the C/B of the fuel pump(s) of any tank. For
 R all other C/Bs, if the flight crew coordinates the action with maintenance,
 R the flight crew may reengage a tripped C/B, provided that the cause of
 R the tripped C/B is identified.

COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

PROCEDURE

To perform a computer reset :

- Select the related normal cockpit control OFF, or pull the corresponding reset pushbutton or circuit breaker
- Wait 3 seconds if a normal cockpit control is used, or 5 seconds if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding reset pushbutton or circuit breaker
- Wait 3 seconds for the end of the reset.

WARNING

Do not reset more than one computer at the same time, unless instructed to do so.

NOTE : Due to the many customization possibilities of the C/B panel :

Before taking any action on the C/B panel, the flight crew must crosscheck that the C/B label corresponds to the affected system.

COMPUTER RESET TABLE

The computers most prone to reset are listed in the table below, along with the associated reset procedure or FCOM reference, when applicable.

Specific reset procedures included in OEB or Temporary revisions are not referenced in this table and, when issued, supercede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.
- The following computers are not allowed to be reset in specific circumstances :
 - . ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
 - . BSCU (Brake Steering Control Unit), if the aircraft is not stopped. (Refer to 3.04.32).
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TRs or OEBs. Before taking any action on other computes, the flight crew must consider and fully understand the consequences.

CAUTION

Do not pull the following circuit breakers :

- SFCC (could lead to SLATS/FLAPS locked).
- ECU or EEC, EIU.

Also refer to the FCOM 3.04.24.

NOTE : In the table's "reset" column, the "if applicable" note signifies that, depending on the computer standard, the reset procedure may no longer be necessary. If this is the case, the reset procedure is removed from the applicable FCOM section.

ECAM ADVISORY CONDITIONS

SYSTEM	CONDITIONS	RECOMMENDED ACTION
R CAB PRESS	CAB VERTICAL SPEED V/S > 1800 ft/min	CPC changeover is recommended : MODE SEL MAN Wait 10 seconds, then : MODE SEL AUTO
	CAB ALTITUDE altitude ≥ 8800 ft	MODE SEL MAN Manual pressure control
R ELEC	CAB DIFF PRESS △P ≥ 1.5 psi in phase 7	LDG ELEV ADJUST If unsuccessful : MODE SEL MAN Manual pressure control
	IDG OIL TEMP ≥ 147°C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities is greater than 1500 kg (3307 lb).	FUEL MANAGEMENT CHECK If a fuel leak is suspected, refer to the FUEL LEAK procedure. For limitations, see 3.01.28.
	Fuel temp is greater than : 45°C in inner cell, or 55°C in outer cell.	GALLEY OFF
	Fuel temp lower than – 40°C in inner or outer cell.	Consider descending to a lower altitude, and/or increasing Mach to increase TAT.
OXY	Cockpit oxygen bottle pressure < 800 psi.	If mask is not being used, check if it is correctly stowed, as per FCOM 1.35.20.
APU	EGT > EGT MAX – 33°C (inhibited during APU start).	
	OIL QTY (LOW OIL LEVEL message pulses).	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 hours.

ECAM ADVISORY CONDITIONS (Cont'd)

SYSTEM	CONDITIONS	RECOMMENDED ACTION
ENG	OIL PRESS P < 16 PSI	<ul style="list-style-type: none"> If oil pressure is between 16 and 13 psi (advisory), continue normal operation. If oil pressure is below 13 psi (red indication), without the ENG OIL LO PR ECAM warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty). <p>In both cases, monitor other engine parameters, especially oil temperature and quantity.</p>
	OIL PRESS P > 90 PSI	<p>Closely monitor other engine parameters for symptoms of engine malfunction.</p> <p>If high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight.</p> <p>Record high oil pressure, and corresponding N2 readings, for maintenance action.</p>
	OIL TEMP T > 140°C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><i>Note : If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</i></p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended :</p> <ol style="list-style-type: none"> 1. Low Speed - Increase engine speed to increase fuel flow, and thereby cool IDG oil. 2. High Speed - Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.
	OIL QTY < 3 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 240°C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 6 units N2 ≥ 4,3 units	<p>Refer to the HIGH ENGINE VIBRATION procedure.</p> <p><i>Note : The advisory threshold may be decreased by a MCDU procedure at the level of vibration reached during the last flight.</i></p> <p><i>If this function has been activated, the N1 and N2 VIB indication will respectively pulse below 6 and 4.3.</i></p>

**TAIL STRIKE**

In the event of a tailstrike, apply the following procedure :

LAND ASAP

– MAX FL 100 or MSA

500 feet/minute should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1000 feet/minute, except for the final approach that must be performed normally.

Notify the ATC of the aircraft's rate of climb.

– RAM AIR ON

– PACK 1 and 2 OFF

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

– LANDING WEIGHT CHECK

- If the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below) :

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

– FOR LDG USE FLAP 3

Conf 3 is preferred, to minimize a configuration change in short final.

– GPWS LDG FLAP 3 ON

– Delay gear extension.

NOTE : – If the approach is flown at less than 750 feet RA, the "L/G NOT DOWN" warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pushbutton, located on the ECAM control panel.

– A "TOO LOW GEAR" warning is to be expected, if the landing gear is not downlocked at 500 feet RA.

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2000	4000	6000	8000	10000	12000	14000
0	77.0	76.0	69.0	63.0	58.0	53.0	48.0	45.0
5	77.0	76.0	69.0	63.0	58.0	53.0	48.0	45.0
10	77.0	76.0	69.0	63.0	58.0	53.0	48.0	45.0

VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

NOTE : For CG < 25 %, add 2 knots to VLS CONF FULL and VLS CONF 3.

W(1000KG)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	130	134	138	142	146	148
VLS CONF 3 (KT)	110	115	120	125	130	135	139	143	147	151	153

+

CORRECTION

5KT⁽¹⁾ |
 1/3 HEADWIND
 (EXCLUDING GUST)
 MAX=15KT

WHICHEVER IS HIGHER

=

VAPP

$$V_{APP}^{(2)} = \text{MAX}(VLS + 5Kt^{(1)}; VLS + W_{IND\ CORR})$$

NCLS-01-0004-000AA210AA

- (1) The 5-knot increment is required when the A/THR is used, or when an autoland is performed.
- (2) In case of ice accretion, Vapp must not be lower than :
 - VLS + 5 knots in CONF FULL
 - VLS + 10 knots in CONF 3
 In case of strong or gusty crosswind greater than 20 knots, Vapp should be at least VLS + 5 knots. The 5 knot increment above VLS may be increased up to 15 knots at the flight crew's discretion.

R

SPEEDS

OPERATING SPEEDS (KT)

CG ≥ 25 %

W (1000 KG)	F	S	Green dot FL < 200*	V _{LS} CONF 3	V _{REF}
40	117	152	165	110	106
44	122	159	173	115	111
48	128	166	181	120	116
52	133	173	189	125	121
56	138	179	197	130	125
60	143	185	205	135	130
64	148	192	213	139	134
68	152	197	221	143	138
72	157	203	229	147	142
76	161	209	237	151	146
78	163	211	241	153	148

For CG < 25 % add 2 knots to V_{LS} and V_{REF}

* Above FL200 add 1 knot per additional 1000 feet

LANDING DISTANCE WITHOUT AUTOBRAKE

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

COST INDEX

For a quick determination of the CILRC, use :

- CILRC = 25 kg/min in the FMGC
- or
- CILRC = 35 (100 lb/h) in the FMGC.

* For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note :
- . Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
 - . On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
 - . Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
 - . Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
 - . The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

BRAKING MISBEHAVIOURS

AFFECTED ECAM : NONE

PROCEDURE :

A – UNCOMMANDED BRAKING :

1. AT TAKE OFF BEFORE POWER SET :

- Check hydraulic pressure on the yellow triple indicator :

● IF RESIDUAL PRESSURE IS INDICATED :

- Depress several times the brake pedals until release of residual pressure
- If residual pressure remains, the take off must be cancelled and the valve has to be changed.

2. DURING FLIGHT :

- Avoid any action on brake pedals

3. DURING APPROACH AFTER LANDING GEAR EXTENSION :

- Check hydraulic pressure on the yellow triple indicator

● IF RESIDUAL PRESSURE IS INDICATED :

- Depress several times the brake pedals until release of residual pressure
- If residual pressure remains, apply brakes at touchdown. A slight brake deflection (3°) will supersede any previous yellow pressure.

Note : If antiskid is inoperative maintain a symmetrical braking as soon as the aircraft touches the ground.

B – BRAKING ON YELLOW SYSTEM :

If asymmetric braking is experienced :

- modulate braking as appropriate.

*** END OF OEB PROC N° 078 ***

OPERATION OF CENTER TANK PUMPS

AFFECTED ECAM : NONE

PROCEDURES :

The flight crew should perform PROCEDURE A, as indicated below. However, the flight crew may apply PROCEDURE B instead, only if maintenance and/or engineering personnel confirm(s) that this aircraft has :

- Center tank pumps with P/N 568-1-27202-05R or 568-1-27202-02R, or
- Center tank pumps manufactured by Intertechnique (P/N P99C38-601 or P99C38-605), or
- The center tank deactivated, and kept empty for the entire flight, in accordance with AMM center tank deactivation procedure (Chapter 28-21-00 P. Block 401).

PROCEDURE A

FUEL LOADING

Refueling

Before refueling, all fuel pumps must be turned OFF, in order to prevent them from automatically starting during the refueling process.

- If the total Fuel On Board (FOB) after refueling is below or equal to 12 000 kg (26 500 lb), or above 15 000 kg (33 000 lb), automatic refueling process can be followed.
- If the total FOB after refueling is between 12 000 kg (26 500 lb) and 15 000 kg (33 000 lb), manual refueling is necessary.
 - 2 000 kg (4 500 lb) of fuel must be put in the center tank
 - The remaining quantity should be shared between the wing tanks
 - If the wing tanks are full, put the remainder of the fuel in the center tank.

After fuel distribution, the wing tanks may not be full when there is fuel in the center tank. This is acceptable for the flight.

If the fuel quantity in the center tank is below 2 000 kg (4 500 lb), the fuel must be considered unusable, and the center tank pumps must be turned OFF for the entire flight.

OPERATION OF CENTER TANK PUMPS (cont'd)

PROCEDURE A (CONT'D)

If the total FOB after refueling is above 12 000 kg (26 500 lb), then the takeoff Center of Gravity (CG) must be determined using the revised fuel index data, and checked within the revised operational takeoff CG envelope, as explained in the Airbus Flight Operations Telex (FOT) reference STL 999.0047/06 Revision 1. If the revised fuel index data and the revised operational envelope are not used, the following table shall be used to check the takeoff CG :

	Move the forward limit of the operational takeoff CG envelope by	Move the takeoff CG by
FOB ≤ 12 000 kg (26 500 lb)	No change	No change
12 000 kg (26 500 lb) < FOB ≤ 15 000 kg (33 000 lb)	2% MAC aft, for A318 & A320 1% MAC aft, for A319 No change for A319CJ	2% MAC forward, for all aircraft
FOB > 15 000 kg (33 000 lb)	2% MAC aft, for A318 & A320 1% MAC aft, for A319 No change for A319CJ	No change

Ground Fuel Transfer

Do not start a fuel transfer from the center tank, if it contains less than 2 000 kg (4 500 lb) of fuel. Do not start a fuel transfer from an inner cell of a wing tank, if it contains less than 700 kg (1 550 lb) of fuel. If a tank has less than the required quantity, it is necessary to add fuel (via a transfer from another tank or refueling) to enable a transfer to take place.

Defueling

When performing a pressure defueling of the center tank, make sure that the center tank contains at least 2 000 kg (4 500 lb) of fuel. If it has less than the required quantity, then transfer fuel to the center tank. Defuel the aircraft normally, and immediately turn OFF both center tank pumps after the FAULT light on the corresponding pushbutton-switch comes on.

When defueling the wing tanks, do not start the fuel pumps if the fuel quantity in the inner cell is below 700 kg (1 550 lb). If the fuel on the aircraft is not sufficient to achieve the required fuel distribution, then transfer fuel or refuel the aircraft to obtain the required fuel quantity in the wing tank.

PAGE 3 OF 6

OPERATION OF CENTER TANK PUMPS (cont'd)

PROCEDURE A (CONT'D)

CENTER TANK PUMPS OPERATION

WARNING

Do not turn on the center tank pumps, if the center tank contains less than 2 000 kg (4 500 lb) of fuel, even if it is requested by another procedure.

Before and during refueling :

- ALL TK PUMPS OFF
- IF THE TOTAL FOB AFTER REFUELING IS LESS THAN OR EQUAL TO 12 000 KG (26 500 LB)**

After refueling :

- CTR TK CHECK EMPTY
If fuel remains in the center tank, it must be considered unusable.
- L and R TK PUMP 1 and 2 ON
- CTR TK PUMP 1 and 2 MAINTAIN OFF
- FUEL MODE SEL MAN

OPERATION OF CENTER TANK PUMPS (cont'd)

PROCEDURE A (CONT'D)

■ IF THE TOTAL FOB AFTER REFUELING IS MORE THAN 12 000 KG (26 500 LB)

After refueling :

- CTR TK QUANTITY CHECK
Check that the center tank contains at least 2 000 kg (4 500 lb) of fuel.

■ CASE 1 : If the fuel quantity in the center tank is between 2 000 kg (4 500 lb) and 3 000 kg (6 500 lb) :

After refueling :

- L and R TK PUMP 1 and 2 ON
- CTR TK PUMP 1 and 2 MAINTAIN OFF
- FUEL MODE SEL MAN

In flight :

- When FUEL AUTO FEED FAULT caution triggers, or the fuel quantity in one wing tank (inner + outer) is below 5 000 kg (11 000 lb) :

- CTR TK PUMP 1 and 2 ON

- If FUEL CTR TK PUMP 1(2) LO PR caution triggers :

- CTR TK PUMP 1(2) OFF

CAUTION

Turn OFF the associated CTR TK PUMP without delay.

- If no fuel leak :

- FUEL X FEED ON

- When FUEL CTR TK PUMPS LO PR caution triggers, or when the center tank is empty :

- CTR TK PUMP 1 and 2 OFF

- FUEL X FEED OFF

CAUTION

Turn OFF both CTR TK PUMPS without delay.

OPERATION OF CENTER TANK PUMPS (cont'd)**PROCEDURE A (CONT'D)**

- **CASE 2 : If the fuel quantity in the center tank is above 3 000 kg (6 500 lb) :**

After refueling :

- ALL TK PUMPS ON
- FUEL MODE SEL CHECK AUTO

The flight crew should note on the computerized flight plan the estimated position or time when the center tank fuel quantity will drop below 3 000 kg (6 500 lb).

In flight :

- CTR TK QUANTITY MONITOR

- When the fuel quantity in the center tank is between 2 000 kg (4 500 lb) and 3 000 kg (6 500 lb) :

- FUEL MODE SEL MAN
- CTR TK PUMP 1 and 2 OFF

Note : If the fuel quantity in the center tank inadvertently goes below 2 000 kg (4 500 lb) prior to being checked, and the CTR TK PUMPS have not been turned OFF, the flight crew must perform the following steps :

- If the fuel in the center tank is required for the flight :
Maintain the CTR TK PUMPS in the ON position. Set the FUEL MODE SEL to MAN. When FUEL CTR TK PUMP 1 or PUMP 2 or PUMPS LO PR is triggered on the ECAM, or when the center tank is empty, turn OFF both CTR TK PUMPS without delay. Do not apply the subsequent procedures.
- If the fuel in the center tank is not required for the flight :
Turn OFF both CTR TK PUMPS and do not turn them back on for the remainder of the flight. Consider the center tank fuel as unusable. Do not apply the subsequent procedures.

- When FUEL AUTO FEED FAULT caution triggers, or the fuel quantity in one wing tank (inner + outer) is below 5 000 kg (11 000 lb) :

- CTR TK PUMP 1 and 2 ON

- If FUEL CTR TK PUMP 1(2) LO PR caution triggers :

- CTR TK PUMP 1(2) OFF

— CAUTION —

Turn OFF the associated CTR TK PUMP without delay.

- If no fuel leak :

- FUEL X FEED ON

- When FUEL CTR TK PUMPS LO PR caution triggers, or when the center tank is empty :

- CTR TK PUMP 1 and 2 OFF
- FUEL X FEED OFF

— CAUTION —

Turn OFF both CTR TK PUMPS without delay.

OPERATION OF CENTER TANK PUMPS (cont'd)

PROCEDURE B

Apply PROCEDURE B instead of PROCEDURE A, only if maintenance/engineering personnel confirm(s) that this aircraft has :

- Center tank pumps with P/N ending in -05R or -02R, or
- Center tank pumps manufactured by Intertechnique, or
- The center tank deactivated, and kept empty for the entire flight.

FUEL LOADING

Refueling

Before refueling, all wing tank pumps must be turned OFF.

Ground Fuel Transfer

Do not start a fuel transfer from an inner cell of a wing tank, if it contains less than 700 kg (1 550 lb) of fuel. If a tank has less than the required quantity, it is necessary to add fuel (via a transfer from another tank or refueling) to enable a transfer to take place.

Defueling

When defueling the wing tanks, do not start the fuel pumps if the fuel quantity in the inner cell is below 700 kg (1 550 lb). If the fuel on the aircraft is not sufficient to achieve the required fuel distribution, then transfer fuel or refuel the aircraft to obtain the required fuel quantity in the wing tank.

PAGE 1 OF 1

NOSE LANDING GEAR

AFFECTED ECAM : NONE

PROCEDURE :

If unable to retract the landing gear after takeoff, make a second attempt approximately one minute later (maximum time to achieve complete extension of the shock absorber).

*** END OF OEB PROC N° 101 ***

PAGE 1 OF 5

ENGINE BLEED FAILURE LEADING TO PROBABLE DUAL BLEED LOSS

AFFECTED ECAM : AIR ENG 1(2) BLEED ABNORM PR
AIR ENG 1(2) BLEED FAULT
AIR ENG 1(2) BLEED LO TEMP

PROCEDURE :

If one of the following three warnings is triggered, the associated procedures may help avoid the loss of both bleeds.

AIR ENG 1(2) BLEED ABNORMAL PR

- If wing anti-ice is ON, and both packs are on :
 - PACK (on the affected bleed side) OFF
One pack must be switched OFF, when the pilot is using wing anti-ice, due to precooler performance.
 - X BLEED OPEN
- If the precooler outlet temperature of the remaining bleed exceeds 240°C within 2 minutes after the crossbleed valve opening :
This indicates that an undetected failure affects the remaining bleed.
 - X BLEED SHUT
 - WING ANTI-ICE OFFAVOID ICING CONDITIONS

STATUS :

The status displayed on the ECAM is correct, unless the precooler outlet temperature exceeds 240°C. If the precooler outlet temperature exceeds 240°C, the applicable status is as follows :

AVOID ICING CONDITIONS.

Note : If in icing conditions, and if the aircraft's altitude permits, consider switching OFF the remaining pack, reopening the crossbleed valve, and turning ON the wing anti-ice system.

PAGE 2 OF 5

ENGINE BLEED FAILURE LEADING TO PROBABLE DUAL BLEED LOSS (cont'd)**AIR ENG 1(2) BLEED ABNORMAL PR (Cont'd)****■ If wing anti-ice is off, and both packs are on :**

- X BLEED OPEN
- PACK FLOW LO (A319/A320)
ECON (A321)
- AFT CRG HOT AIR (if installed) OFF

● If the precooler outlet temperature of the remaining bleed exceeds 240°C within 2 minutes after the crossbleed valve opening :

This indicates that an undetected failure affects the opposite side.

- PACK (on the first affected bleed side) OFF
The remaining pack automatically delivers high flow.

STATUS :

The status displayed on the ECAM is correct.

Note : *If the precooler outlet temperature exceeds 240°C, if in icing conditions and if the aircraft's altitude permits, consider switching OFF the remaining pack, reopening the crossbleed valve, and turning ON the wing anti-ice system.*

PAGE 3 OF 5

ENGINE BLEED FAILURE LEADING TO PROBABLE DUAL BLEED LOSS (cont'd)**AIR ENG 1(2) BLEED FAULT**

- ENG BLEED affected (if not automatically closed) OFF
 - With the ENG BLEED pushbutton on, the FAULT light remains on.
 - With the ENG BLEED pushbutton OFF, the FAULT light goes off, when the failure (overheat or overpressure) disappears.
- **If wing anti-ice is on, and both packs are on :**
 - PACK (on the affected bleed side) OFF
One pack must be switched OFF, when the pilot is using wing anti-ice, due to precooler performance.
 - X BLEED OPEN
- **If the precooler outlet temperature of the remaining bleed exceeds 240°C within 2 minutes after the crossbleed valve opening :**

This indicates that an undetected failure affects the remaining bleed.

 - X BLEED SHUT
 - WING ANTI-ICE OFF

AVOID ICING CONDITIONS

STATUS :

The status displayed on the ECAM is correct, unless the precooler outlet temperature exceeds 240°C. If the precooler outlet temperature exceeds 240°C, the applicable status is as follows :

AVOID ICING CONDITIONS.

Note : *If in icing conditions, and if the aircraft's altitude permits, consider switching OFF the remaining pack, reopening the crossbleed valve, and turning ON the wing anti-ice system.*

PAGE 4 OF 5

ENGINE BLEED FAILURE LEADING TO PROBABLE DUAL BLEED LOSS (cont'd)**AIR ENG 1(2) BLEED FAULT (Cont'd)****■ If wing anti-ice is off, and both packs are on :**

- X BLEED OPEN
- PACK FLOW LO (A319/A320)
ECON (A321)
- AFT CRG HOT AIR (if installed) OFF

● If the precooler outlet temperature of the remaining bleed exceeds 240°C within 2 minutes after the crossbleed valve opening :

This indicates that an undetected failure affects the opposite side.

- PACK (on the first affected bleed side) OFF
The remaining pack automatically delivers high flow.

STATUS :

The status displayed on the ECAM is correct.

Note : *If the precooler outlet temperature exceeds 240°C, if in icing conditions and if the aircraft's altitude permits, consider switching OFF the remaining pack, reopening the crossbleed valve, and turning ON the wing anti-ice system.*

PAGE 5 OF 5

ENGINE BLEED FAILURE LEADING TO PROBABLE DUAL BLEED LOSS (cont'd)**AIR ENG 1(2) BLEED LO TEMP**

In flight, bleed temperature is too low for correct wing de-icing.

- A/THR OFF
- THR LEVER (affected engine) ADVANCE
Thrust lever of the affected engine must be advanced with A/THR OFF. This may increase bleed temperature.

■ IF UNSUCCESSFUL, and the opposite bleed is available :

- X BLEED OPEN
- ENG BLEED (affected) OFF
- Associated PACK (if the other pack is on) OFF
One pack must be switched OFF, when the pilot is using wing anti-ice, due to precooler performance.

● If precooler outlet temperature of the remaining bleed exceeds 240°C within 2 minutes after the affected bleed is set to OFF :

This indicates that an undetected failure affects the remaining bleed.

- X BLEED SHUT
- WING ANTI-ICE OFF

AVOID ICING CONDITIONS

STATUS :

The status displayed on the ECAM is correct.

Note : If the precooler outlet temperature exceeds 240°C, if in icing conditions and if the aircraft's altitude permits, consider switching OFF the remaining pack, reopening the crossbleed valve, and turning ON the wing anti-ice system.

■ IF UNSUCCESSFUL, and the opposite bleed is unavailable :

- WING ANTI-ICE OFF

AVOID ICING CONDITIONS

STATUS :

The status displayed on the ECAM is correct.

*** END OF OEB PROC N° 149 ***

PAGE 1 OF 1

INCORRECT GRID-MORA VALUE DISPLAYED ON THE NAVIGATION DISPLAY BY THE FMS

AFFECTED ECAM : NONE

PROCEDURE :

If the aircraft latitude is South, or if the aircraft longitude is West,
DISREGARD the Grid-Mora value that may be displayed on the Navigation Display.

Note : The highest and lowest elevations that may be displayed on the Navigation Display by the Peaks function of the EGPWS (if installed) are not impacted by this misbehavior, and are correctly computed.

*** END OF OEB PROC N° 162 ***

PAGE 1 OF 1

DUAL FM RESET UPON RADIAL FIX INFO ENTRY

AFFECTED ECAM : NONE

PROCEDURE :

A) Preventive Procedure :

Do not use the FIX INFO function with any radials that could intercept the F-PLN just before the last point of the approach (less than 0.1 NM).

Note : The last point of the approach corresponds to the runway threshold for an ILS approach, or to the Missed Approach Point (MAP) for a Non-Precision Approach (NPA).

B) Recovery Procedure :

If disengaged, consider reengagement of the AP/FD and ATTHR.

While the FMS is recovering, consider using RMP backup tuning for navigation.

1) If the F-PLN is not lost :

Normal FMS operation can be recovered by clearing the radial FIX INFO, and then by re-entering the GW/CG.

2) If the F-PLN is lost :

When the FMS has automatically recovered, perform the associated procedures (ref. QRH 2.02B).

*** END OF OEB PROC N° 169 ***

PAGE 1 OF 1

NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

AFFECTED ECAM : NONE

PROCEDURE :

During a non precision approach, when using the FINAL APP managed guidance mode :

- At DA(DH) or MDA(MDH), or earlier in approach if visual conditions are obtained, DISENGAGE the FINAL APP mode by de-pressing the APPR pushbutton on the FCU.

When the flight crew de-presses the APPR pushbutton in order to disengage the FINAL APP managed guidance mode, a basic vertical guidance mode, either V/S or FPA, engages.

This ensures that the SRS and GA TRK guidance modes correctly engage, if the flight crew initiates a go-around slightly below MDA (MDH).

***** END OF OEB PROC N° 188 *****

PAGE 1 OF 2

ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES**AFFECTED ECAM : NONE****PROCEDURE :****For RNAV approaches :****For any approach labelled as RNV on MCDU :**

- **VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold**

On the MCDU FPLN page, if the last waypoint of the active FPLN, displayed in green, is identified as a runway (e.g. LFBO32L), it means that the runway threshold is the MAP.

- **If the MAP is located at the runway (RWY) threshold, use of the vertical managed guidance mode (FINAL APP) is possible**
- **If the MAP is not located at the Runway (RWY) threshold :**
 - **DO NOT USE vertical managed guidance (FINAL APP)**
 - **USE NAV mode for lateral guidance**
 - **USE SELECTED vertical guidance mode only (FPA is recommended)**
 - **DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.**

Note : Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

PAGE 2 OF 2

ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES (cont'd)

For LOC, or LOC back course (B/C) approaches :

- CHECK the position of the MAP on the approach chart
 - If the MAP is located at the runway (RWY) threshold, the VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.
 - If the MAP is located before the runway (RWY) threshold :
 - DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.
